44 3D Library The photos app allows you to add static 3D elements to your existing photos and videos. There is a staggeringly large library

available, and you can spice up your photos in creative ways. Select a photo, then go to **Edit & Create > Add 3D effects > 3D Library**. There are vehicles, spaceships, animals, plants, buildings and more options available. You can look for a particular element, or browse through them one by one. Click on any object, and Photos will import the asset, which takes some time. Now comes the fun part. Photos automatically guesses the rotation and size of the object depending on where in the image you place it. You can also manually position and rotate the asset, according to your preference. Once you are satisfied, click on **Save a Copy** to create a new image, without overwriting the original file.

45 Add folders to collection By default, the photos apps only catalogue the images and videos stored in the Photos and Videos folder of the Windows user. You can add custom folders here, including folders from network drives, to improve your experience with the Photos app. Open the Photos app, and go to **Folders > Add A Folder**,

and select the folder that you want to include in the Photos app. You can add only one folder at a time.

46 Motion Track Drawings

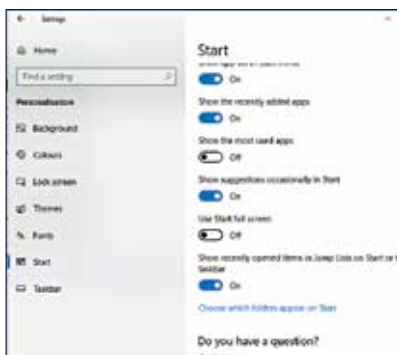

You can add custom ink drawings to a video, and then anchor them to a person or object within the video. What hap-

pens after this is that as the person or thing moves within the video, the ink drawing will follow them around automatically! This is a great way to spice up videos. Select the video within the Photos app, then click on **Edit & Create**, and then on **Draw**. Now, you can draw on the screen directly, with a range of pens, sizes and colours available. Once you have drawn something, click on the anchor icon, and link it to any object on the screen. Now, play the video and the drawing follows the anchored object or person around.

47 Full Screen Start Menu

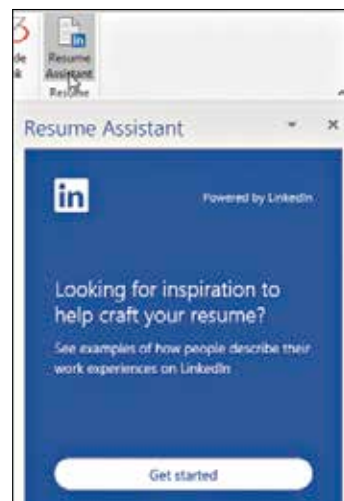

If you want to get at things more quickly, you can use a full screen Start Menu. To do this, click on **Start**, then go to **Settings > Personalization > Start Menu**, and then toggle Full Screen Start menu. Now, you can click on Choose which folders appear on start to customise the

menu. You can also resize the regular start menu by just dragging the edges.

highlight, and customise your resume according to job openings. Once you have finished updating your resume, or writing a new one, you can directly apply to open job positions from within Word itself. Go to **Review > Resume Assistant** to use this feature.
