

you need to recover a file, in the Control Panel, there will now be an option to Restore your files with File History. This can also be found by searching through the start menu. You can now browse the histories of each file, and compare the versions through a preview window. Press the green restore button to replace the current file with a previous version from the history. Right clicking on the restore button will allow you to save a previous version of a file, as a copy, at a new location.

50 Use Storage Sense

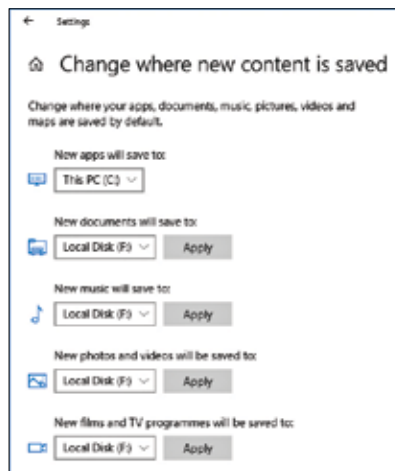

You can smartly set up Storage Sense to periodically clean up your hard drive, and save work for you. For example, it will empty

out the Recycle Bin periodically, and can be configured to wipe the downloads folder. If you are consuming podcasts, content from archive.org, or download photos for resharing on IM clients, and do not want to manually wipe your downloads folder, this is a simple way to do it. However, do remember to move away the files you do require to other folders. Go to **Settings > Storage** and toggle **Storage Sense** to **On**. Then go to **Change how we free up space automatically**, and select a periodicity for clearing up the Downloads folder.

51 Change default storage

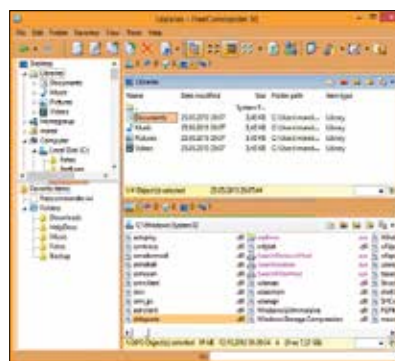

Over a period of use, the drive in which Windows is installed tends to get filled. To keep this space clutter free, you can change the default location for saving new software, documents, music, photos, videos and so on. This also prevents you from manually having to move your data around, to manage storage space. Go to **Settings > Storage > Change**

where new content is saved. Then, individually select the target location for the type of content, and click on Apply.

52 Replace your file manager

If you work a lot with Windows Explorer, managing files and so on, then the default experience is just not good enough. A great replacement file browser is FreeCommander, which has a dual panel interface, allowing you to work with multiple folders at the same time. You can do some pretty smart things such as compare folders, synchronise folders (for backups), check MD5 sums, shred files, and very importantly, delete duplicates. If dual panels do not cut it for you, then there is Q-Dir, which gives a four panel view, that

can be configured in many ways. This file manager might not look very pretty, but is very functional.

53 Use the Converter

The calculator functionality has now expanded, and it works as a full fledged converter. You no longer have to search for conversions, then navigate to a particular site if Google does not do it

right away. In the calculator menu itself, there are options for currency, volume, length, weight, mass, temperature, area, speed, energy and others. These can be used to quickly convert measurements from one unit to another. Some dynamic conversions, such as currency, may need an update for rates, which can be done from the converter itself. Otherwise, it is pretty handy and accurate.

54 Enable File History backup

Losing your local files can be frustrating if your work doesn't include the usage of cloud backup services. Apart from losing your files, sometimes you might want to go back to a previous draft of an article or paper that you were writing. Windows has a feature to enable the history of all the older versions saved from time to time. Essentially, it's like the revision history feature seen on the Google suite of cloud services such as Docs and Sheets. Instead of a cloud service, Windows saves the backup of the files in an external hard drive which can be a pen drive as well. First you have to enable File History. Go to **Settings > Backup** and tap on the '+' icon. Plug in your external hard drive and select the drive. File History will instantly start archiving your data from the user folder of your system. You can enable or disable automatic backups. If you aren't keen
