

on automatically backing up everything and want more control over it, then click on **'More options'** below the slider. Here you get more granular control over the backup including the intervals at which you want the drive to back up files and for how long do you want to keep your backups. Then you can specifically select the folders you want to backup if you're not interested in backing up everything. Scrolling down will give you options to stop using the drive and change it to another drive.

Now that you've enabled File History backup, you can easily access the previous versions of the files. Head over to the location of the file in File Explorer. Right-click on the file and select **Restore previous versions**. Now you will be able to see all the older versions listed, allowing you to restore to any one of them."

55 Your phone companion

If you're looking for an easy tool to view and move the photos from your phone, then Microsoft's Your Phone Companion app is the way to go. To set things up, first you will have to download the respective apps from the Windows Store and the app store of your mobile device. Then you will have to sign in to your Microsoft accounts on both the apps and allow all the permissions in your mobile device. After that,

your phone will be connected to your PC through the app. Now, you can view your photos, videos and messages from your phone inside this app on your PC. Microsoft announced that they'll be soon discontinuing this feature, so use it while it lasts.

56 Microsoft remote desktop control

The ability to connect remotely has been a part of Windows for quite a while now. However, now you can access your PC from even your Android or iOS devices. Do note that this feature is only supported on Windows Professional and Enterprise versions, not on the Home version. Go to **Settings > Remote Desktop** and enable it. Next, download the Microsoft Remote Desktop app from the appropriate app stores. Launch the app and tap on the '+' icon on the top right. Here you are going to add the desktop you want to control remotely. Enter the PC name that can be found under the Remote Desktop settings in Windows. The app can automatically scan the desktop in your network

as well. Otherwise you can add it manually. The only difference is that you have to manually add the Host name or IP address. For a complete rundown, let's follow the manual process. To find your IP address, open up command prompt and insert the command **'ipconfig'**. Your IP address will be displayed beside 'IPv4 Address'. Enter the IP address in the app and then it will detect whether a

PC is available on that connection. You will also have to enter your username and password for the connection. If you aren't aware of your username, open up command prompt and enter **'echo %username%'** and it will display your username. The password is the same as your PC login password. If you don't have to have any, then you will have to create one. Enter both these credentials in the app and now, you will be able to control your Windows PC remotely right from your smartphone.

57 Share to nearby devices

Nearby Sharing was a useful feature introduced in the April 2018 update of Windows 10. It allows you to share files between two Windows 10 PCs who have the feature turned on. This works similar to Apple's AirDrop but there's no support for mobile devices on any platform yet. Also, this feature will only be available to PCs that have Bluetooth or Wi-Fi support. To enable this feature, head over to **Settings > System > Shared Experiences**. Click on the slider of Nearby Sharing and select **'Everyone nearby'** from the dropdown list below. Do the same on the other Windows 10 PC as well. Now, you can share files and links between them. To send files, go to File Explorer and right-click on the file. Select Share and you'll find the other PC listed. Make sure that the PC is in range. Sharing links is limited from the Edge browser only and you'll find a similar Share button on the top right. When you send the file or link, a notification will appear on the other device. Don't worry if you miss the notification since it will go to the Action Center.

58 Delivery optimisation for Windows updates

If you have low bandwidth, it can be painful sometimes to browse the web when there's a Windows update downloading. Earlier, you had no control over how much of the bandwidth the update could use but now you do. Go to **Settings > Update and Security > Delivery Optimisation**
