

> **Advanced Options.** Here, you can set a bandwidth limit for downloads and uploads. For downloads, you can individually set the download limit when the update runs in the background or foreground. The upload settings are used when you're updating other PCs in the same network where the update

is downloaded on your PC and then pushed to the others. Here, you can limit the bandwidth and also the amount of data. In the previous menu, there's an option Activity Monitor where you can check the amount of data that was spent in updates.

59 Microsoft Edge epub reader Did you know that Microsoft Edge now has full blown epub reader capability? Not only can you read books in the epub format, you can do everything that an epub reader software does. You can annotate, highlight, underline and even add notes. And the best part, once you insert these changes, they are saved so when you open the epub file again in Edge, it will be retained. Download any of your favourite free epub books and

open the file in Edge. You will see that it opens up as a book where you can scroll pages with the scroll wheel. In order to add those annotations and notes, all you need to do is highlight the text with your cursor and a menu will pop up. It contains the meaning of the highlighted text followed by buttons to highlight, underline, add note, copy and share. There's a Cortana button as well which does a web search of the word and places all the results in a separate tab on the right.

60 Make command prompt transparent If you have to resort to using CLI tools often, then you probably have an instance of command prompt running all the time and you also have multiple command prompt windows running at the same time. At such times you end up having way too many things on your screen and have to switch between windows frequently. What if you could make your command prompt window translucent so that you could see what's going on in the underlying windows easily. Adding transparency used to require third-party software in the past but now you can do that right from Windows. Just right-click on the title bar of the command

prompt window and open the properties window. Switch to the colours tab and drop the opacity to whatever you feel is comfortable. Between 70-80% works best for us.

61 Ninite Formatting your system and putting together a fresh install can be one of the most time consuming processes. If only there was a way to make things simpler and convert this time consuming process into an unattended install sequence. Ninite does just that. It's a free service that allows you to select some of the most popular software for Windows and then it will create a custom installer

for you that will handle the entire process. Simply run the customised Ninite installer and sit back as it sequentially downloads and installs everything with the default settings. Default? Wouldn't that mean you get signed up for all the additional bloatware? Not with Ninite. That's the fun part. Ninite will pick the right options during the setup process and avoid installing any ad bars or additional software. All that remains is for you to set the correct default software after all the installation is over.

62 SSD Over-provisioning To ensure that your SSD performance doesn't decay quickly, you should over-provision

your SSD. Due to the nature how SSDs are different from normal hard drives, the more space you leave out for the SSDs to use as a temporary dump, the better performance you will have overall. The manner in which SSD performance degrades over time varies from one manufacturer to another primarily on the basis of how the controller functions. Without over-provisioning your SSD will start losing performance around the 50-60% mark. Most SSDs are already over-provisioned right at the factory (about 7% is normal) but the amount of space allocated to over-provisioning is very less. To get better performance overall from your SSD, download and install the software that came with your SSD. For Samsung, it would be the Samsung Magician Software. There will be a separate tab for over-provisioning. Head over there and set the percentage to about 15-20%. Aside from over-provisioning, you should also have about 20% space free for the absolute best performance possible from your SSD. This can be a bit hard since you're wasting space so you need to take a call, whether the absolute best performance is what you're after or
