

### Six stages of Moon eclipse

Photographer Jason Weingart shot a six stage composite photo of the super blood wolf moon total lunar eclipse. <https://digit.in/feb19-35>

### The red cabin over the years

A photographer has been photographing the same the red cabin and its surrounding lake over the years since 2013. <https://digit.in/feb19-36>

Innovative combinations of a number of cutting edge imaging technologies are allowing researchers to explore biological structures in unprecedented detail, and in three dimensions.

Researchers modified normally transparent tumour cells to produce melanin, a natural pigment, to produce this three dimensional image of a tumour.

An image produced using lattice light-sheet microscopy by researchers from MIT, UC Berkeley, HHMI and Harvard Medical School shows the pyramidal neurons in the somatosensory cortex of a mouse brain.

Neurons in the brain of a mouse produced using a combination of expansion microscopy and lattice light-sheet microscopy by researchers at UC Berkeley.

Dopaminergic neurons in the fruit fly brain. These structures are responsible for facilitating activity involving dopamine which is a neurotransmitter.

High resolution image of the somatosensory cortex of a mouse, with the orange coloured pyramidal neurons, and the yellow coloured dendritic spines.

Scientists used photoacoustic microscopy, a combination of laser probes and ultrasound to produce this image of oxygen saturation within a mouse brain.

Photoacoustic tomography of the blood vessels in a human palm. The warmer colours represent blood vessels present at a greater depth.
