

Since 1999, ISRO has launched 275 satellites for international customers, mostly contracted through Antrix, its commercial wing. All the flights used the reliable PSLV rocket, which is ideally sized to launch microsattellites and nanosatellites. ISRO is developing the Small Satellite Launch Vehicle to cater to this market.

23 Flights

The satellites were deployed over 23 missions of the PSLV rocket, one of the most reliable launch vehicles in the world. ISRO has never failed to deploy a contracted satellite.

8524 KG

That is the total mass of all the foreign satellites launched by ISRO so far.

Doves

88 of the satellites in the C-37 flight were from a single contractor, Planet. The mission also holds the record for the most number of satellites launched in a single constellation, the Dove Flock 3p.

Stacking

The co-passenger satellites are stacked below the primary payload, within the nose cone, also known as the payload fairing.

DLR-TUBSAT

Germany and South Korea were India's first international customers, ride sharing on the PSLV-C2 flight in 1999.

PSLV-C38

The CartoSat-2 was the primary passenger on board.

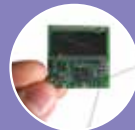

Piggyback

2 co-passenger satellites were the Venta-1 and the Max Valier academic satellites.

Sprites

Piggybacking on the academic satellites were 6 Breakthrough Starshot sprites, prototypes of tiny spacecraft that could one day travel interstellar distances.

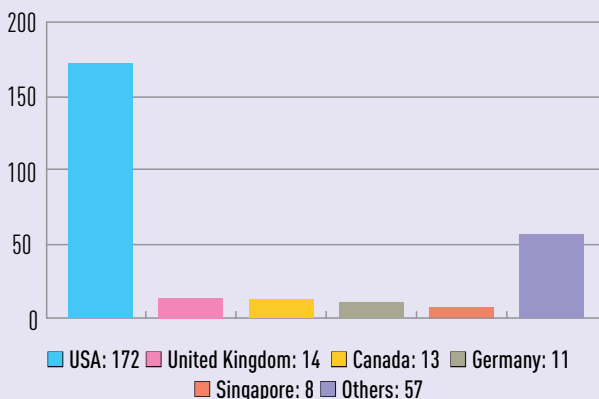

PSLV C-37

The PSLV C-37 mission set a world record by launching 103 nano-satellites and 6 pico-satellites apart from the primary payload.
