

DURACELL ULTRA PROVIDES INCREASED POWER TO YOU AND YOUR DEVICES

THE SCIENCE BEHIND THE STRONG SUCCESSOR TO THE TRUSTED DURACELL COPPER & BLACK BATTERY THAT DELIVERS UP TO 100% MORE POWER*

DURACELL'S HIGH-QUALITY BATTERY – FOR POWER HUNGRY DEVICES IN INDIAN HOUSEHOLDS

The average urban Indian household is equipped with over 12 battery powered devices at a time. 5 of them usually with higher power demands. Especially torches, remote controlled toys or game controllers need reliable long-lasting power to have them perform at their best. In particular, power-hungry motorised toys should boldly run, roll, turn, blink as designed to put a smile on kids' faces again, again and again. Until now this had been the task of Duracell's Copper & Black trusted by Indians in all cities across the country. But today's devices have become smarter, equipped with many more intricate features in need of more power for longer. That's why the well-performing Copper & Black has been made even better. The new Duracell Ultra meets and exceeds today's power needs by providing up to 100% more power*. But what actually makes this new battery better performing?

DURACELL ULTRA – THE SCIENCE BEHIND PERFORMANCE

Duracell batteries are made of high-quality materials. Its canister is made of refined steel and inside the interplay of its key ingredients such as zinc, manganese or graphite efficiently converts chemical energy into electrical. This holds true for Duracell's Copper & Black, but with Duracell Ultra – designed to even better meet advanced device power demands – this process leads to a much better and longer-lasting performance. How is this possible?

DISCLOSING THE SECRET BEHIND "UP TO 100% MORE POWER"*

Duracell Ultra's performance lies in its optimised design which effectively packs in more active materials to deliver quality performance within a power-hungry device. This optimised design contains 3 key components (the anode, the cathode, and the separator) which work together to create a quality battery that delivers strong power. Not only does this design allow Duracell to increase actives, but it also allows for these materials to be available for high utilization during discharge generating more power.

- 1. OPTIMISED CATHODE** – Duracell's Triple Optimised Process, which modifies the cathode enabling higher energy capacity. /CATHODE is the positive terminal which electrons flow to. Usually made of a mineral such as manganese dioxide./
- 2. OPTIMISED ANODE** – Duracell is the only battery brand that makes its own zinc powder. Optimised particle size distribution that enables higher efficiency and more energy! /ANODE is the negative terminal which electrons flow from. Usually made of a mineral Zinc/

3. OPTIMISED SEPARATOR

Duracell's separator paper is designed to drive efficiency through low internal resistance and high ionic conductivity. This means ions can cleverly transfer evenly and efficiently between anode and cathode. /SEPARATOR is the special paper that prevents the anode & cathode from touching each other and thus prevents the battery from short circuiting. The separator, when wetted with electrolyte, also allows the flow of ions from cathode to anode when the battery is discharged in a device./

To effectively convert chemical energy into electrical energy, the battery needs a liquid conductor. That is where the electrolyte comes in. When the anode, cathode, and separator are wet with electrolyte, the battery is ionically conductive, and the chemical reactions can complete to produce the electricity that runs the device. The anode, cathode, separator, and electrolyte are packed in a nickel-plated steel canister with a tin-plated brass nail. And the optimized design along with the physical and chemical properties of the components enable the Duracell Ultra Power battery to deliver up to 100% more power*.

*vs. zinc-carbon batteries across 2015 IEC tests on average. Results may vary by device or usage pattern. (www.lcc.ch)
