Google Improves Android Encryption with Adiantum

Privacy and security take on a new level of importance every couple of years. Perhaps no company knows this better than Google, with its Android ecosystem powering not just high-end smartphones, but also low-powered phones, smart TVs, cars and a host of other devices. To address the encryption requirement on this end of the device spectrum, Google has come up with a new form of encryption called Adiantum. Currently, Android uses the AES encryption standard that isn't compatible with low end devices. Adiantum is five times faster. Adiantum will ship with Android Q devices. The new form of encryption is meant to improve performance of entry level devices.

MOBILE WATCH

Ulefone Armor 6

SG and ruggedness? Not the combination that springs to your mind when you hear either of those words separately? Well, the Ulefone Armor 6 would be the best bet to change your mind. With an IP68/IP69K rating, it suffices to say that this one fulfils the criteria to survive in some of the harshest environments you can throw at it. The phone meets the military standards of dust, shock, water and humidity resistance. It's also protected from solar radiation and extreme temperatures. The massive 5000mAh battery can be charged wirelessly too! It comes with Android 8.1 out of the box and also packs an impressive set of software tools.

APP WATCH

Step Set Go

Buy any number of fitness trackers, sign up for the gym, subscribe to fitness influencers – none of that matters if you yourself do not have it in you to get motivated. We can already hear you groaning and about to move on to the next page. What if you were incentivised to be healthy with a PS4? Or perhaps an iPhone XR? Do we have your attention now?

Step Set Go takes the concept of gamification and applies it to everyday health and fitness. You sign up for the

app with your Google account, give it access to your steps data and you're ready to start earning rewards in the form of StepSetGo coins, or SSG coins. These coins let you purchase things. However, it's not as easy as it sounds.

Indoors, 1000 steps get you a coin, whereas outdoors, 800 steps are enough for a coin. Easy-peasy? Brace yourself for levels. The app has levels with specific requirements and limitations. For instance, level one has an earning cap of 5 coins through walking. To upgrade a level, you have to hit the earning cap three days in a

row. At level 2, you need to earn between 5 to 10 coins a day by walking. Miss that for three days in a row, you downgrade to level 1. Pretty harsh, eh?

The app is pretty well designed. The goals are quite steep. For instance, from a purely step-earned coin pool, you'll need to walk a minimum of six lakh steps to earn an Amazon Echo for 2000 SSG coins. Even if you're at Level 5, with the earning

cap that's going to take you a good 10 weeks approximately. Someone very wise once said that nothing good in this world comes free, or at least, step-free.

Language Navi

Not happy with in-built language support on your favourite apps? Language Navi translates any app into your desired language, although with a little bit of polishing needed.

MindZu

Wrapping well-designed content, quizzes and interactive games into a package intended for teaching mathematics - this one's bound to be a hit among the numerically challenged!

RedPapers

Trust Reddit? RedPapers hooks up a new wallpaper for your smartphone at regular intervals from your favourite subreddit and even recommends a few cool ones to get you started.
