

BlackBerry ups Security game with AI

BlackBerry has announced the acquisition of Cylance, a company developing machine learning and AI-based security tech. <https://digit.in/mar19-46>

Guaranteed job for engineers?

Skill-Lync, an India-based online learning startup promises India's mechanical engineers a job, or their money back. <https://digit.in/mar19-47>

is the convenient approach towards membership and bookings that makes Fitternity interesting.

STANDARDISED APPROACH: CURE.FIT

Instead of focussing on a particular aspect of the fitness world to find a better solution. Cure.fit has instead taken a broad approach to standardise the entire health and fitness ecosystem. Under four umbrellas, eat.fit, cult.fit, mind.fit and care.fit, the platform offers a host of services. Eat.fit is all about getting you healthy food, made to fulfil the nutrition requirements of users. Cult.fit features a range of fitness centres across India, which offer

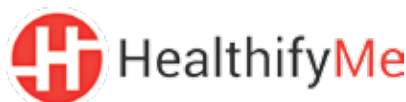

a standardised fitness and workout experience, while also allowing you to undergo basic training online. You can book sessions at Cult centres or even avail memberships. Mind.fit provides you a number of sessions and video based trainings online for meditation and workouts aimed at better mental health. Care.fit is an app only experience where you can avail video consultations with doctors and even visit a Care.fit health centre for diagnostics. As you can see, Cure.fit is focussed on addressing the entire fitness ecosystem and is doing it quite well.

A HEALTH BOT: HEALTHIFYME

While HealthifyMe gained a lot of popularity due to its robust and exhaustive Indian food calorie tracking feature, currently, it is leveraging tech in a lot of other, more advanced ways. Perhaps the most notable of them all is Ria, or as the current version is known as, Ria 2.0. A fitness chatbot

based on millions of diet logs made by HealthifyMe users over the years, Ria has clocked some pretty impressive numbers. According to HealthifyMe, Ria is the first port of call for over 51% customers today, even when they have a choice to speak to a human coach.

Her accuracy is greater than 75%, message per use per day is 4+ and overall rating is 4.3/5. As compared to a regular coach, users who interact with Ria ask 20% more questions than those who interact with a coach.

"She classifies on the basis of proportion of calories contributed by what are categorized as qualifying (healthy) or disqualifying (unhealthy) macro/micro nutrients.", says Punita Mittal, Head Data Science, HealthifyMe, "Currently, Ria learns on the basis of stated preferences and calorie requirements of users based on their goal. If fitness goals change, the diet plan and calories associated with it evolve."

BLOCKCHAIN FITNESS: BOLTT

While it is a popular trend to conjure up applications of blockchain in all kinds of sectors, an Indian startup has gone ahead and done it in the field of fitness. Boltcoin, from the same people as the fitness wearable startup Boltt, is described by the same people as a "decentralised digital health economy based on Blockchain". Users on the platform completing their health goals are rewarded with BoltCoins, which can be used for purchases on partner stores online and offline. This entire system is im-

plemented using various aspects and applications of blockchain.

For instance, Boltt's Health Reward Engine are based on a Smart Contract, making it difficult to fake steps or manipulate the data. Also, Boltt platform challenges, tournaments and games are recorded on the Blockchain, making a middleman or a host unnecessary. The market is also based on a decentralised system, and requires network consensus for BoltCoin transactions to be completed. "In addition to this," says Aayushi Kishore, Co-Founder at Boltt, "We also plan to launch smart apparel and smart audio in the near future."

A COMPLETE ECOSYSTEM: GOQII

GOQii is no new name in the world of fitness startups. However, there's much more to their platform beyond the fitness wearables they manufacture. For instance, the GOQii Referee feature, available only to premium users, can identify food and its nutritional information from a picture

clicked by the user. This technology is powered by artificial intelligence and image recognition technology. This, along with guidance from a human coach, provides the user well-rounded information to take efficient dietary decisions.

When it comes to their devices, GOQii has stepped out of its comfort zone of a couple of years and dabbled into multiple areas with Stride, RunGPS and the upcoming VitalGluco and VitalECG. "GOQii's advanced and connected health ecosystem effectively tracks the entire lifestyle and other habits of an individual and suggests preventive healthcare solutions basis the assessment." says Vishal Gondal, Founder and CEO, GOQii, "We aim at changing the lifestyle and food habits of users, enabling a permanent shift to a healthier lifestyle."
