

AI to screen diabetic eyes

Google and Verily are using AI to screen patients for diabetic eye conditions for the first time, in India. <https://digit.in/mar19-42>

Apple's 2020 iPhones to get 5nm SOCs

A recent report suggests Apple will start using TSMC's next-generation 5nm process technology in its iPhones next year. <https://digit.in/mar19-43>

WORKSHOP

Customise your own newsfeed

with friends whom you might have removed from your friend list. For the app, go to Settings and Privacy > Settings > News Feed Preferences and then follow the same procedure.

TRAIN THE FACEBOOK AI

Although this isn't an instant fix, the results will show up after a few days or weeks. You probably know that the newsfeed content is now based on interactions between you and your friends, while also taking into account what your friends are doing with their friends. Not to forget, it also includes the activity going on in the pages that you've liked. All of this is observed by the Facebook AI or news feed algorithm to finally present you the best according to them. If your news feed is flooded with unwanted content

and even unrelated ones, don't just scroll over them but tell the AI to not show them to you. How do you do this? On the top right corner of every post, there's a three-dotted icon that opens a dropdown list. Select 'Hide post' and it will disappear from your feed. If there's a particular type of content you're trying to get rid of, then make sure that you do this every time. The

same procedure is valid for the mobile app. You should see the changes happening over a few days.

TURN ON LATEST TWEETS

Twitter kept going through a lot of changes in how its timeline worked in recent years. Originally, they had a chronological timeline but then moved to an algorithm-powered one that pushed in tweets from second-degree and sometimes even third-degree connections in your timeline. It also showed tweets from accounts with whom the people you follow were interacting. This resulted in a lot of unwanted tweets in the timeline. However, this year, Twitter brought back the feature to view your timeline based on the latest tweets. They retained the previous

algorithm-powered timeline but allow the user to toggle between them. In order to do so, you'll see an icon on the top right of the app that will open up a tab where you can select 'See latest Tweets instead'.

CLEAN YOUR FOLLOWING LIST

If you created your Twitter account and mindlessly kept following everyone, your timeline must be a mess! If you haven't been doing

some regular cleaning, your following list must have reached to more than a thousand. Back in the day, Twitter allowed you to mass unfollow accounts rather than having to manually unfollow every account. Third-party services could fetch the entire list of your following and you could unfollow accounts by a simple checkbox. However, Twitter has revoked the API access to such services, so say goodbye to the majority of the bulk unfollowing services. You're left with the manual process but there's

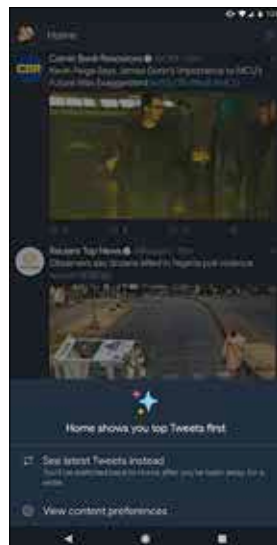

Tokimeki Unfollow

another way to make it fun with less confusion. Tokimeki Unfollow is a web tool that acquires your entire following list and serves a fun way to go through them. The tool gets its inspiration from the Netflix show Tidying Up With Marie Kondo where material things are disposed they don't 'spark joy' in you. The same concept is followed, except for Twitter accounts you follow. Once you've authenticated your account, you will be asked how do you want them to appear one after another. From then on, all your following list will start appearing and you can choose to keep them or unfollow. Although it might seem laborious, it offers better presentation so that you can make an informed decision on whether to unfollow someone. A profile's bio and their latest tweets are displayed, and accordingly, you decide whether their content 'sparks joy' or not. [4](#)

Restrict the content you see

Latest tweets instead of top
