

A lens that can see behind itself

This 'hyperfish-eye' lens with a 270-degree field of view, allows it to view up to about 45 degrees behind the camera. <https://digit.in/mar19-48>

Galaxy Note 10 with quad-cam

As per a new report from SamMobile, the Note 10 is tipped to have a four-camera setup on the back. <https://digit.in/mar19-49>

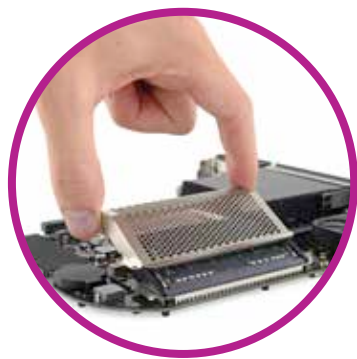

Teardown: Apple Mac Mini 2018

Upgradeable and easy to repair

Abhijit Dey | abhijit@digit.in

Partial upgradability

Apple moved away from soldered RAM chips to SO-DIMM RAM on the latest Mac Mini. This allows you to upgrade memory later when you need it. However, CPU and storage aren't upgradeable since they are still soldered onto the logic board.

RAM shielding

With the right set of tools and experience, you can replace the RAM modules on your own. On the inside, you'll come across a shielding around them. This protects the RAM from interfering with the other components.

Soldered ports

Over time, you'll have to ensure you take good care of all the ports. Any damage or wear and tear to them will require a replacement of the entire logic board for repair. None of them are modular.
