

Switch unofficial Android support

Developers have modded Nintendo Switch in order to get it to run Android OS though there's no GPU support at the moment. <https://dgit.in/mar19-81>

Assistant on Maps, Messages

Google Assistant can look up directions, alter routes in Google Maps, get suggestions on the Messages app. <https://dgit.in/mar19-82>

Plantronics BackBeat FIT 305

Rugged build, weak bass

The BackBeat FIT 305 is meant for the gym going demographic through and through. The design is IPX5 rated and features P2i coating so you're safe against sweat damage, rain and spills. The cable is a nylon braided piece, with reflective material weaved into it, making it easily identifiable at night. Due to the nature of the fabric, it also doesn't cause as much friction against the skin as a rubber coating. We're not entirely sure if it is due to the coating, but the earbuds on the FIT 305 are highly prone to dust.

It won't be easy to replace the buds either since they are proprietary. Another problem with the FIT 305's build is that residual noise

from the wire brushing up against anything is carried straight to the ear.

In any sports-oriented headphones, the lows are expected to be the most formidable aspect of the

sound signature. However, the FIT 305 doesn't handle those well. The bass sounds muddy and flat, which is

especially evident when you push the volume to higher levels. In the gym, that might be a problem. The mids are handled quite well, which benefits vocals and hands-free performance. Even in noisy environments like a public bus, the FIT 305 managed to block out most external sound during our experience.

The FIT 305 does actually provide great overall performance and isn't a bad deal at all.

Honor View 20

Setting the new benchmark

The Honor View20 features a very good looking build, especially on the back, but is also quite slippery and a fingerprint magnet. Huawei has retained the headphone jack on the Honor View20, along with an IR blaster. The colours on the display panel are impressively balanced, as long as it is set to the neutral colour profile and not vivid. Popular games like PUBG and Asphalt 9 clock impressive framerates on the View20. The phone also does not slow down when pushed with resource-heavy apps. The rear camera did quite well in our tests whereas the front camera did leave room for improvement. The Honor View20 is a

smartphone that could easily be punching above its weight class. It brings a number of impressive features, all of which more or less work as advertised. This includes the Time of Flight system, the 48-megapixel camera with the Sony IMX586 sensor and to some degree, even the punch hole design for the notch.

The performance is within what is expected from a high-end flagship, but they barely just managed to reach the Qualcomm Snapdragon 845 scores. With the Snapdragon 855 on the horizon, we do ex-

pect the gap in benchmark numbers to widen, but don't think it would have a huge discernible impact. The IPS-LCD panel may not be the brightest but is definitely wonderful for watching movies and shows on. There's also some impressive battery life. The Honor View20 is a solid step in the right direction from Honor and definitely gives OnePlus something to think about.
