01

Maintain connectivity

For certain critical applications such as mobile gaming, it is necessary to be connected to the internet all the time. While it might not

be economically feasible to use mobile data all the time, you can have it as a backup option if you have a spotty WiFi connection, or prevent dropping out of a game in case there is a disruption in the line. To be able to do this, first you have to enable developer mode in your device. This can be done by going to **Settings > System > About phone** and tapping on the Build number 7 times. From the 3rd tap, a countdown starts appearing, notifying how many taps you are away from unlocking the developer mode. Once developer mode is unlocked, go to **System > Developer Options** and toggle Aggressive Wi-Fi to mobile handover, as well as Mobile data to always active.

With these two options toggled on, whenever the network quality deteriorates, the device will switch to a mobile connection. By keeping the connection active even when there is a WiFi signal, the device can fall back more quickly to the mobile network. With this, you can enjoy uninterrupted gaming sessions on PUBG, Asphalt or Star Legends.

02

Force Split Screen for all apps

To force all apps to run in split screen mode, you will have to first enable developer options, then go to **Settings > System > Developer Options** and turn on the **Force activities to be resizable** option. Now you can select any one app by long pressing it, and drag it to the top of the screen to use the split screen mode. You can use this feature in a number of ways, for example watch-

ing a YouTube video while chatting with friends, or monitoring your social network feeds while browsing the net at the same time. Even if the developer did not support the split screen mode natively for the app, this process forces all apps to run in the split screen mode. Note that some applications, particularly games, may be buggy in this mode. You can adjust the slider to decide how much screen real estate each application occupies. To get rid of the split screen, simply drag the slider all the way to the bottom, or all the way to the top.

03

Monitor your network traffic usage

Your phone probably has a live network indicator that gives you information on your upload and download speeds. By default, your phone also monitors how much data was
