

spent on cellular and Wi-Fi that can be seen on a per app basis. However, all these options are present at different places and can't be monitored at one single location. To bring everything at one place in a visually pleasing way, you should use Glasswire Data Usage Monitor. It tracks all your network traffic, both cellular data and Wi-Fi, giving you a graph of data used by the apps. It gives you a summary of your daily consumption of data so that you don't exceed your network plan, and it can also give you alerts if you're close to hitting the data limit. Before Android Pie, the app also had a live bandwidth monitor but that has disappeared for now because of changes in Google's API, according to them. The developers plan on finding a fix for this soon.

04 Monitor your phone usage

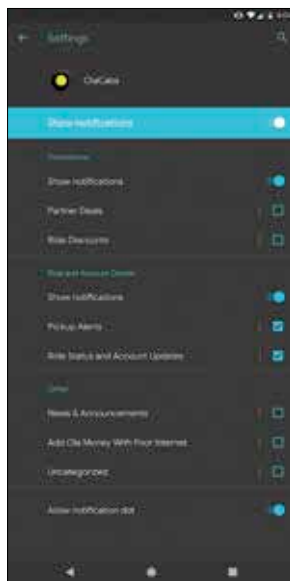

Do you use your smartphone throughout the day and sometimes feel like it's getting too much? Then you should definitely start monitoring your usage to exactly see for how many hours are you actually using the phone. Along with Android Pie, Google released their Digital Wellbeing app that does exactly this. However, it isn't officially available on every phone and also, available only in Android Pie. If you happen to have a device running Pie then download the Digital Wellbeing APK from APKMirror here: <https://dgit.in/DigiWell>. Make sure that you download and install the latest version. Once installed, open the app from and Apps and

Notifications, and allow all the required permissions it asks including usage access. Launch the app and from then on, it will start tracking your app usage. The app appears under Settings but if you want an icon, then enable 'Show icon in the app list' inside the app. In the home page, it will display your total screen-on time, number of unlocks and notifications. For a detailed view of per app usage, open Dashboard and it will show you the time spent on every app.

05 Turn off specific notifications from apps

Before Oreo, you could only turn off all the notifications from an app. However, devices with Oreo and above

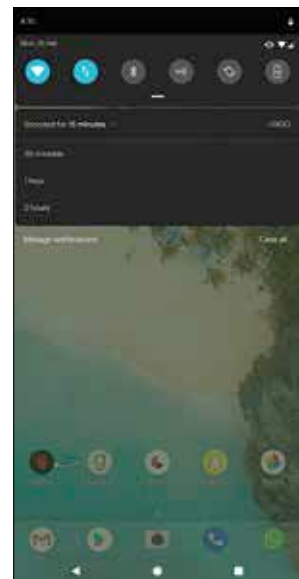

brings in the feature called Notification Channels. It gives users more granular control over app notifications. There are different types of notifications that apps push to users. You'll receive the primary type of user-generated notifications that include replies, likes, shipment status, cab booking status, etc. These are essential and you wouldn't want to turn them off. But there are many apps out there, especially shopping apps, that go all out with notifications regarding sales, shopping festivals, price drops, deal alerts, etc. You can now turn these off if you're using an Android Oreo or above device. Head over to **Settings > Apps and Notifications**. Tap on the desired app and then go to Notifications. Now, if the developer of the app has followed the guidelines, you will see a few notifica-

tions categorised according to their types such as Promotions and Account Details. Under those categories, it will show the exact type of notification and if you don't want them to appear on your device, you can turn them off. A quicker way to reach this menu would be long pressing the app icon and open the App Info page. Then tap on Notifications. Another way is to tap on 'Manage notifications' below the actual notification in the notification menu. Do note, this feature will only be available in apps that have implemented it.

06 Snooze notifications

Oreo onwards, Android users received a feature to snooze their notifications. This works out best for exciting deal alerts that you might want to check out later or an email that's important but doesn't require your immediate attention. It's also fairly easy to use. When a notification arrives, slide the notification to the left or right slightly but don't swipe it away because then you'll lose the notification. Tap on the clock icon on the left that will give you a dropdown list of different time

intervals of 15 minutes, 30 minutes, one hour and two hours. Select your desired snooze time and it will reappear later.

07 Turn off animations for snappier transitions

When you open the app drawer or launch an app, there's a transition animation in between. This
