

expected. Once the app is started, there will be four icons persisting on screen, till the app is closed. The record button starts recording. The settings button allows you to access more detailed

features. Here, the sound can be toggled on or off, and users can set a custom resolution. There is also an option to layer a video feed from the front camera, over whatever is being recorded on the screen. You can also record the sound from the microphone. Bear in mind that the app does not record the sound directly from the device, and will pick up any background noises in addition to the sound from the application. To stop the recording, tap the blinking red dot on the lower right corner. The position of the start and stop buttons can be changed by tapping and dragging, to prevent the video recording interface from interfering with whatever it is that you are recording on your device.

Type in Indic Languages

This is a useful little feature that can help out a wide range of people around you, from aged parents, domestic help, or friends who are not proficient in English. Go to **Settings > System > Languages & Input**, then select the language of your choice. Bear in mind that for some languages, Google supports multiple scripts. For example, Hindi can be configured to transliterate from English (type in English alphabets, the letters will appear in Devanagari on screen), or allow the user to natively type in Devanagari. If any single language has multiple keyboards available, they

appear when that language is chosen as a submenu along the top edge of the screen, and you can make a choice. You can add multiple languages, such as English, Hindi and Marathi. Tapping on any of the languages and dragging it to the top will change the entire interface. However, in Android this does not really change or customise the user interface for local users, and the interface is directly translated. A superior experience for Indic language users can be obtained by opting for a phone with Indus OS on it.

The Indic Language Keyboard is available as a separate app from the Play Store, to make it easier for users to type in local languages. If the Google Indic Language keyboard is installed, Hinglish is available as a language option, and users can draw out the Hindi words on the screen to type. The draw to type option is not available for other languages. At present, the Indic Language Keyboard supports only 12 local languages. The Swalekh Flip keyboard by Reverie Language Technologies

supports all the 22 official languages of India, apart from English. The keyboard supports predictive input, swipe typing, and a phonetic typing mode for transliteration. Additionally, a joystick cursor interface allows navigating through large blocks of texts incredibly easy. Users can also switch between different input modes while typing, so that they do not have to go back to the settings to select a different kind of input. This is the best third party Indic language keyboard app in our experience.

Control your Google logins from your phone

When we install apps on our Android devices, we are usually prompted to login before we can start using them. One of the features available to most apps is to use a Google login. This allows users to login into the app with their Google accounts. Occasionally, this also allows apps access to some account data, which is clearly declared at the time of granting permission. However, once you're done with the app and have uninstalled it, that doesn't necessarily un-link your account from the app. To do that from your phone, go to **Settings > Google > Apps Connected**. Here you will see a list of apps where you've logged in with your Google Account. Tapping on any particular app shows you what the app can access. There's also a Disconnect button that you can tap to disconnect the app from your Google account. Once you do that, you'll receive an additional prompt to disconnect the app. Once that is done, according to Google,

it might take upto an hour to reflect the same on their end.
