

go to **Settings > Accessibility > Sound Amplifier**. Change the **Use Service** toggle to the on position. You can now adjust the settings to decide how much to amplify low volume sounds by. You can also fine tune the information processed by the microphone, to reduce the amount of loud background noises, till you have comfortable hearing levels. For those suffering from hearing impairments, the settings can be individually adjusted for the right and left ear. Note that, to use this feature, a pair of wired earphones are absolutely essential. The feature can also be used to get super hearing. Also, you need to have Android 9.0 to use this feature. You can quickly access the settings for further fine tuning, by swiping down and selecting the Sound Amplifier alert.

Manage Notification Dots

Since Oreo, Android has started supporting iOS style notification dots on the apps, but the implementation is more advanced. You can peek into the contents of the notifications from the notification dots, and some apps even provide contextual menus. To enable the feature, go to **Settings > Apps & Notifications** and toggle **Allow Notification Dots**. This is the global setting to turn the feature on or off across the entire OS. Users additionally have the option of deciding which of their applications should show notification dots. To toggle these settings, go to **Settings > Apps & Notifications > See all xx Apps** (xx will be the total number of apps installed on the device that support notifications). Then scroll through the

list, tap on any app, go to App notifications and toggle Allow notification dot. Depending on the application and the manner in which notifications are implemented by the developer for that particular app, additional options will be available on this screen.

20 How to manage permissions of all apps

As you keep on installing several apps on your phone, it could become overwhelming to remember what kind of permissions those apps have been granted. Maybe you quickly allowed them permissions during the initial setup or you'd want to revoke certain kinds of permissions from a set of apps. Manually going and unchecking the permissions on every app can be a nightmare if you have hundreds of them installed. However, Android offers an easier way in Settings. Open 'Apps & notifications' inside Settings and then go to **Advanced > App permissions**. All kinds of permissions will be listed here including your hardware and basic functionalities. It will also show how many apps ask for permission to them and how many have been allowed. Tapping on them will open up a list of the apps that ask for that particular permission and here you will be able to allow or revoke permission easily.

21 Remap your phone's buttons

Button Mapper is a powerful tool that reconfigures what the hardware buttons on your device do. Once you

install the app, you can select each of the buttons and decide what they do. The app is pretty versatile as it allows three ways to interact with every button, which is a single press, a double press, and a long press. Users can tweak the duration of the double press and long press detection, down to a single millisecond. You can additionally fine tune the vibration feedback for some actions. The buttons can be used to trigger apps, or perform native OS operations such as toggling bluetooth, or turning on the flash. Customising the back and recent apps button requires users to purchase treats worth ₹200, ₹500 or ₹1,000 for the developers. Any of the purchases unlocks all the features of the app. One of the most useful features is the ability to switch out the recently used apps and the back app buttons, as these are configured differently on devices from various manufacturers, and users might be used to another layout. Do note that using the app reduces the amount of security your device has. The screen lock will not be used for enhanced

data encryption. The app requires root access, can observe everything you do with the device, retrieve content from windows you are viewing and understand everything that you type, including emails and passwords.

22 Lower your phone's resolution

You can significantly boost the performance of your games on older or less powerful devices, by forcing a different screen resolution. The app can
