

it mentions if an app listed there has implemented advertising and user tracking (called as 'Anti-features') so that you can stay clear of them. In order to download F-droid, you will have to do it manually from <https://dgit.in/fdroid>. After downloading, install the APK and browse through the app store. To know if an app has the anti-features implemented, it will be highlighted in their description.

GPS Alarm

This is an incredible little app that will prevent you from oversleeping during a commute. In fact, you can use this app to ensure that you can enjoy a nice and comfortable nap

while you are travelling. Essentially what the app does is sound an alarm when it reaches a particular location, as against a particular time. There are many GPS alarm apps available on the store, the one that we use and is highly rated is called Naplarm, developed by Yash Pradhan. You just have to enter in your destination, and select a radius, somewhere between 750 meters to 1 kilometer is recommended. The application continues to work in the background, and will alert you when you are near your destination. You can set the alarm tone as per your choice, as well as volume and vibration duration. It is that simple.

Disclaimer: From this point on, the tips are meant for smartphones with an unlocked bootloader or with root access or even both in certain cases. We aren't responsible for any damage caused to your device.

Remove bloatware after rooting

Rooting your Android phone in this age doesn't make too much sense because of the workarounds and pain it brings for other services. Some apps won't work at all like payment and banking apps, whereas some apps won't allow you to login such as Snapchat. There are a few tricks to overcome those problems but you'll have to keep doing every time there's an update along with compromising some system feature. If you're willing to go through all this pain, then go ahead. With a rooted phone, you can do many things like uninstalling all the bloatware in your phone. Sometimes, there are just too many and not all of them can be uninstalled without root. Even if an app claims it can uninstall all your system apps without root, it's technically impossible without giving root access. One way to get rid of them is to disable them that prevents them from appearing in your app drawer and running in the background. However, if you also want to free up a lot of space, then uninstalling them with root permissions is necessary. After you're done rooting your phone, use any file explorer that supports root access like Solid Explorer. Tap on the Root storage then navigate to **System > App** and manually delete the bloatware. An easier way would be installing Titanium Backup, selecting the system apps (marked in red) that you want to remove and uninstalling it.

Overclock your phone

Your smartphone is usually set at an optimal clock speed that ensures balanced battery life and performance. Hence, there's always some room to push the clock speed higher to churn out that extra

performance at the cost of battery life. In order to overclock your CPU, you will require root access as well. Not all kernels will support overclocking, so it's always best to take some time for research and select a custom kernel. When you find a good one, you can simply flash it using a custom recovery. If you're using a custom ROM, they usually tend to pack a custom kernel but you have to ensure it supports overclocking. With all the necessary flashing done, it's time to download an overclocking software for your kernel. Sometimes, a custom kernel will also install a companion app and it's best to use that one. Otherwise, you can download any app from the Play Store. We used Kernel Adiutor. Open the app, slide out the menu from the left and go to CPU under Kernel. This will throw a lot of options your way but you're only interested in 'CPU Maximum Frequency' under 'big frequencies'. Tap on it and you'll get a list of several frequencies. Select the immediate higher frequency than the current one and check for stability and heating. If everything seems fine, then gradually increase it. Do note that once you start
