

Puma and Tetris collab

After the recent release of Tetris 99 on Switch, Tetris has announced that there will be tetris inspired Puma Shoes coming soon. <https://digit.in/mar19-62>

Chris Hemsworth as Hulk Hogan

Thor's Chris Hemsworth will play wrestling super star Hulk Hogan in his upcoming biopic for Netflix <https://digit.in/mar19-63>

Bend...and snap!

A classic case of "what were they thinking?"

Boo-Man | boo@digit.in

Y

es, I'm aware I dissed "foldable" phones in December. But that was before we actually got to see the stuff that people like Samsung, LG, Huawei and others actually launched. You'd think they'd have me eating humble pie for my rant, but instead I can now inform you, things are far worse than even I imagined!

The one thing I hate about all big launches is the hype built around them. I guess I'm old school and prefer that a product creates its own hype by just being that good, rather than big flashy events trying to convince you that every little ordinary feature is mindblowing. Damn you Apple for popularising this ridiculousness.

Now, you've already read enough about what Samsung launched before MWC and what others launched at it, and perhaps have read multiple opinions about what was good or great about the new phones. I'll throw my hat into the ring and say I think the Galaxy S10s are refreshing, and I'm very tempted to buy one. I think I still

have some liver left to donate... it is a good thing that they regenerate.

The 5G model is currently pointless for India, because although many manufacturers are trying to make their flagship phones future-proof, I don't think we will see proper 5G networks before 2020, at which point there ought to be newer models that will be far more powerful and perhaps even be much better value for money. Buying a 5G phone today is like buying an 8K TV... looks good on paper, but you're paying so much more for features you just cannot use, that it is a pointless waste of money.

And that leaves us with the Fold...

Bendable, rollable and foldable displays have been spoken of for over a decade now, and there are plenty that were shown off at MWC this year. Samsung has beaten the others to launch, but that by no means is all there is to it. These displays are technically bendable displays rather than foldable displays. If you look carefully at the launch video (since no one has hands-on with the device so far), you will see that the Galaxy Fold doesn't, well, fold. At the point where the hinge is, there's a rather large gap, where the display curves and bends. Over the next few years we expect to see this solved in some way, and no doubt we will eventually get proper foldable displays, but that isn't the case now.

Huawei's Mate X prototype (shown off at MWC) seems to hide this bending-and-not-folding flaw better by bending the display outwards instead of inwards – ending up with a much larger display than the Galaxy Fold, both when folded up and also when opened out. However, the point to remember here is that the Galaxy fold has two screens, while the Mate X has one screen. What this means is that, when folded up, the Galaxy Fold has a proper "back" of the phone, while the Mate X when folded up has screens on both sides, which makes it prone to scratching and fingerprints. With the Fold, the main screen is always protected when folded in your pocket or bag.

The prices of such pioneering devices is going to be sky high, and thus, they're not really something that's meant for you and me to own. As "luxury" devices, they're essentially meant for people who want to burn money to try and be exclusive. Besides, they're bound to be buggy, and the low numbers of devices sold will translate to rather pathetic app support.

Hardware trouble might also rear its ugly head, as it usually does when there is an all new category that hasn't really been proven in the market yet. Folding and bending and hinges means moving parts, and that means wear and tear... something we haven't had to deal with for ages. We might very well be talking less about bending and more about snapping soon – thus the headline, and the silly Legally Blonde screen-grab.

For now, at least, I think all this folding screen business is overhyped. I'm sure a few tech generations (about 3 years) from now things will be very different, but if you hear anyone going ga-ga over foldable displays, do me a favour and slap them back to reality will you?
