

ProtonMail blocked in Russia

The state Federal Security Service of Russia has told ISPs to block encrypted email provider ProtonMail. <https://digit.in/apr19-39>

Nvidia Launches \$99 Jetson Board

NVIDIA just launched the budget-friendly Jetson Nano, a single-board computer geared for robotics and AI. <https://digit.in/apr19-40>

to control bleeding on the battlefield. According to reports, their haemostat products have been used by over 500 military groups in the country, including the Indian Army, the CRPF, the National Security Guard, and the Indian Navy. While Axiostat, their most popular product, is not the first haemostat, it is the first one from India to get a clearance from the US Food & Drug Administration for US sales and is definitely the cheapest. In comparison to a ₹20,000 price for imported haemostat, the military use Axiostat goes for ₹2,500. No pressure is required by Axiostat during or after application. Once it has been applied, the dressing can be removed - within 48

hours - by wetting it, following which it converts into a gel. This can simply be peeled away without moving the clot underneath it. Going forward they want to take their solutions beyond the battlefield, which is indicated in Maxioce, their latest offering, that takes care of minor to moderate wounds and scar recovery.

ideaForge

This startup is credit with developing India's first full autonomous VTOL UAV. Since 2008, ideaForge has been manufacturing drones and UAVs for the Indian Army. Their UAVs have been used in critical missions like the Uttarakhand rescue operations in 2013, and the Pampore attack in 2016 among many others. They primarily manufacture quadcopters and fixed wing UAVs, and supply over 90% of drones procured by the Indian government, according to their own claims. So far, this IIT Bombay startup has received more than \$10million in funding. They recently announced a partnership with HCL for the DRYICE AIOPS Platform for zero touch automation of ideaForge's devices.

This will bring remote drone ops capabilities to the Indian army. Their main products include Q series UAVs which are highly portable and targeted at recon missions, NETRA Pro and NETRA V series with higher payload and usage capabilities and the Switch UAV for long duration photogrammetry operations.

CRON Systems

An IoT startup based out of Haryana, CRON Systems makes intrusion detection systems that are aimed at border security. Its clientele includes the Border Security Force (BSF) of India as well as the Indian Army. Infrared and laser detection technology powers the initial product line, the KV series. It provides notifications upon border infiltration in all terrains and weather. According to CRON systems, the systems have already been implemented at the Indo-Pak border. Currently, CRON Systems' research lab is working on automated drones and smart fencing. They've focussed on the lack of a communication structure, lack of adequate infrastructure to install new age products, and the

high complexity of such products preventing end users from using them effectively. Broadly, their system can be described as sensors installed on endpoints lining the borders, that have a range of up to 200m, and send

an alert via encrypted channels to an analytics platform when an intrusion is detected. The system can also classify and track the threats it detects. The startup has recently inked an MoU with Quanergy Systems Inc. to upgrade the detection features of its Kavach Z series of border security offerings. Quanergy works in developing LiDAR sensors and smart sensing solutions. Its technology will give Kavach detection capabilities that extend beyond the perimeter of its design, making one unit enough to cover a radius of 200m.

VizExperts

Strategizing is more than half the battle in most cases, and New Delhi-based VizExperts addresses that particular area in their quest to aid

the Armed Forces. A bootstrapped geospatial intelligence company, VizExperts aims to transform military data for the decision making cycle. Launched back in 2006, it started off as a software provider for integrated solutions and services in the visual computing field, eventually moving into product development. Their main provision is based on Digital Sand Modelling (DSM) technology (a combination of 3D graphics, high-resolution satellite data, simulation and geographic information system) which is being used by the military extensively. The integrated solution is built on a 3D GIS platform and includes audio visual hardware and interaction devices that works with a backend GIS database alongside terrain data for the entire country.
