

Tinder ditches "Elo"

Tinder no longer relies on "Elo" desirability score, instead using new secret algorithm that sounds similar. <https://digit.in/apr19-35>

Wireless display app by Microsoft

Cast your PC and Steam games to your Xbox One with Microsoft's new "Wireless display" app. <https://digit.in/apr19-36>

being waited on by gamers and analysts alike. AMD is sort of the good guy in the gaming business. NVIDIA has the real-time ray-tracing capabilities locked to RTX GPUs only, until AMD comes around and showcases real-time ray-tracing running on 1.5 year old GPUs. It's no wonder that NVIDIA expanded their real-time ray-tracing feature-set to the older generation GPUs within a few days of AMD's Neon Noir showcase. Then there's the FreeSync vs G-Sync battle that AMD seems to be winning owing to the number of monitors that support FreeSync over G-Sync.

So I can't get a CPU because there will be something better just a few months away, I could probably get RAM modules but I'd rather wait for the prices to drop further. And

I'm certainly not getting a GPU with an overpriced gimmick of a feature. There are hardly any games that support it out of the box and the ones that do, end up with massive FPS penalties the moment it is turned on. Game engines have only just showcased their implementations of real-time ray-tracing which means that it will be a while before game developers incorporate it en masse into their upcoming titles.

It's not like I can't afford it, I simply don't like being taken for a ride. Having said all of this, there's one fact that seems unbearably obvious. In these last two years, we've seen the greatest leap in CPU performance, an equally large bump in GPU performance and RAM prices have been the lowest since 2016-17.

So while I'm being a negative nancy about all of this, the simple fact is that this is probably the best time to get a PC for us Indians. The competition is intensifying between manufacturers and every single month from now on, until the end of year looks good for the industry. COMPUTEX, the mother of all PC tech conventions is only a few months away and we'll see a plenty of technology and hardware launches, and upgrades but it'll be a while before we get our hands on the new tech so now's as good a time as any. So if you're in the mood to get that fancy new high refresh rate monitor or perhaps you want to get the latest 8-Core CPU, then you might as well go ahead but if your current configuration is fine then I'd suggest waiting for a few more months. 🚩

BUYING ADVICE

BUDGET HEADPHONES

Q Hey Agent001,
I want to buy a headset between ₹1000 to ₹2000.

Can you list all the headphones coming in that range sorted by the best first.

Sony MDR-XB450

Also, I have done some digging and came up with these two headphones <1>Boat Rockerz 400 on ear Bluetooth headphones and <2>Sony MDR-XB450.

Which is the best one among these two headphones?

—Madhav Bhavsar

A Hi Madhav,
Under ₹2000, I would definitely recommend the Sony MDR-XB450, especially if your preferred genres of music are EDM and Hip-Hop. If you absolutely need a mic on your headphones, then you can pick the XB450AP version. However, if you would prefer something with a more neutral signature, you can go with the Audio-Technica ATH-S100iSBK.

When it comes to wireless, the boAt Rockerz 430 is currently a recommendable product just within your budget. It performs well and comes with an in-line microphone, as well as the ability to operate in both wired and wireless modes.

THE RIGHT MOUSE

Q Hey Agent001,
I want some advice to buy a gaming mouse :-

1. I found two listings online with the same name, could you tell me which is the legit one?
2. Should I buy G402 instead? (it has better reviews but Digit recom-

mended this instead in the config section). Thanks in advance.

—Sarika

A Hi Sarika,

1. Looks like both of them are listings posted by different sellers. We would recommend you to go with the one labelled 'Amazon's Choice'. It means that a lot of buyers have purchased

Logitech G402

- that product via that particular listing and has received positive feedback.
2. The Logitech G402 is quite a popular gaming mouse. With regards to performance, you might not notice much of a difference in tracking accuracy compared to the Razer DeathAdder Elite. It's up to your personal preference of the brand, design and your budget. Both mice have good software support. If RGB lighting is something you want, then the DeathAdder does it better. 🚩
