

liked or given a thumbs up. Depending on what you liked, the songs will only appear in your Spotify playlist if it's available on the platform.

CONTROL SPOTIFY PLAYBACK WITHIN GOOGLE MAPS

Switching between Spotify and Google Maps while you're driving can be dangerous. You're left with letting your playlist go its own course on shuffle. However, Google sent out an update that integrates certain music streaming apps into Maps while the navigation screen is on. To enable this feature, open Maps and go to Settings > Navigation settings. Enable 'Show media playback controls' and it will scan your system for supported apps. Select Spotify and you're done. Now, whenever you navigate to a destination, a Spotify icon will appear. Tap on it to display the playback controls on the bottom.

TRANSFER PLAYLISTS TO SPOTIFY

Did you recently switched to Spotify? If yes, then your library must be empty and creating the entire playlist from your previous music streaming service might seem like a daunting task. Fret not because there are a few tools out there that make it easy to transfer your playlists between these services. If you're on desktop, Soundiiz

(<https://dgit.in/Soundiiz>) is a powerful tool. Create an account on the platform and connect the appropriate music services including Spotify. Once connected, Soundiiz will list down all your playlists from these services. Select the playlist you want to transfer and click on Convert. Then you will need to follow the instructions and select the destination, i.e., Spotify. On mobile devices,

you can use the Stamp app (<https://dgit.in/Stamp>) to do the same.

PLAY YOUR LOCAL MUSIC

Did you know the Spotify desktop client can also play your local music files? To enable this feature, head over to Edit > Preferences or press Ctrl + P. Scroll down to 'Local music' and enable it. Click on 'Add a source' and browse to the location of your files. Make sure you enable 'Music Library' and all the songs should be listed under 'Local Files' in your library.

USE YOUR PHONE AS A REMOTE CONTROL

With a premium subscription, you can quickly switch between your connected

devices. One of the connected devices can be used as a remote control. Say, you want to control the music on your desktop or TV with your phone. Ensure that Spotify is connected on the other devices. On your phone, tap on the song to open the album art page and then tap on the highlighted device name in green at the bottom. Here, all your connected devices will be listed. Tap on the device where you want to play the music and it will automatically start playing. Now, you can control the music from your phone while it plays on another device.

USE OPERATORS FOR REFINED SEARCH RESULTS

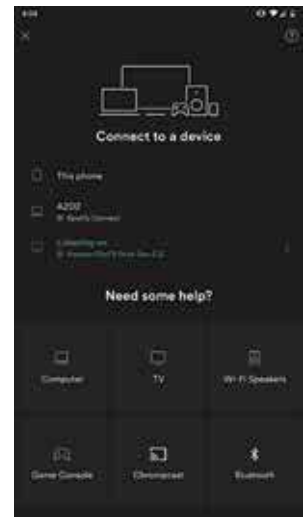

Searching for songs or albums is easy from the search bar. To make your search results better, you can use filters to search for specific songs and albums. If you're looking for songs between specific time then you can use the parameters "year:1995" or "year:1995-2005". For example, if you search using "Backstreet Boys year:1995-2005 NOT album:"Never Gone", then all the songs and albums of

Backstreet Boys between 1995 and 2005 except Never Gone will be presented in the search results. The other parameters include "artist:", "track:", "genre:", and you can use "NOT" or "AND" to exclude or include search terms respectively.

CONVERT YOUR LAST.FM HISTORY TO PLAYLISTS

Back in the day, scrobbling your tracks using Last.fm was quite popular and the ones who used to be dependent on the service for recommendations are probably still using it. If you have a vast library of scrobbled tracks on the platform and you want to import them into playlists on Spotify, use Spot-

listr (<https://dgit.in/Spotlitr>). You will have to connect your Spotify account and then pick what history you want to import. This tool also allows you create playlists from Reddit, YouTube, SoundCloud and even text. If you have a list of

tracks in a text file or sheet, just copy and paste them, and the playlist will be created with the available songs. Another app called SpotiLast can be used to build Spotify playlists based on your Last.fm recommendations, if you have been scrobbling.
