

Dubler Studio Kit

Funded: \$125,805 pledged of \$53,027 goal

Link: <https://dgit.in/DublerSK>

Not every musically inclined individual can afford an array of instruments or avail the services of a composer or music arranger. The Dubler Studio Kit aims to make music creation easier by allowing you to use your voice to do it. The kit comprises of the Dubler Software and the Dubler Mic and lets you create MIDI just with your voice.

The kit boasts of broad compatibility with every popular Digital Audio Workstation (DAW). After a brief training of 60 seconds, you can start using the packed low latency

custom USB mic, tuned for the Dubler software. You can track your pitch live during synth control, and select upto eight samples using your voice. It can sustain sounds, samples and notes vocally and is responsive to changes in velocity in your voice. It is also capable of talking to multiple MIDI channels, and can thus enable sample triggering and synth control at the same time. You could even beatbox along your track or use another instrument as a guide as the kit works with non-vocal sounds too.

Mezzone TWS

Funding: US\$ 145,326 pledged of US\$ 10,000 goal

Link: <https://dgit.in/Mezzone>

Earlier this year, we executed and published a comparison test for true wireless headphones. That test showed us that it is difficult to provide a good, compromise-free true wireless experience. The Mezzone TWS (True Wireless Stereo) earbuds promise to provide everything you would expect from a great pair of true wireless IEMs, but at a budget price. The earbuds come with touch control and an IPX7 rating, a combination that usually doesn't show up until much higher in the price scale. According to the Mezzone team, data regarding the ear shape of thousands of people were gathered to design a structure that would provide the best fit on all kinds of ears. The Qualcomm TWS Plus chip on these allows each bud to be paired individually, or used in stereo, and a seamless switch between the two. While the earbuds claim a battery life of 8 hours, the 1000mAh battery in the charging case claims an additional 72 hours, taking the total to a whopping 80 hours which is more than anything that we've tested. To put that into perspective, if you listen to music for about two hours a day on these, you will only charge them about nine times a year. A wireless version of the charging case is also Qi compatible, allowing you to use any Qi charging mat to fill it up, along with USB Type-C charging.

UDrone

Funding: \$2,024 pledged of \$5,000 goal

Link: <https://dgit.in/UDrone>

If you ever wanted to feel like a superhero and control an aircraft with your mind, the UDrone is something that you should definitely get started with. The UDrone is a mind-and-gesture operated drone that can be controlled by what you're thinking. Yes, you heard that right - a mind-controlled drone. The UDrone can also execute subject tracking while its operating. Most of the ways to control it via your brain require a certain amount of concentration. For instance, when you're concentrating

on it to take off, that concentration level needs to be 150. The UDrone also promises to bring a great camera system, with features like real-time image transmission, gesture-controlled capture modes,

UDrone's camera features an f/2.8 wide-angle lens and a 1/3.2 inch Sony CMOS sensor, allowing you to shoot stabilized video at 1080P and stills at 8 MP. The drone is also capable of streaming a real time camera feed to a connected phone. At 85g weight, the drone is super light but can still manage about 25 minutes of flight time. The brain sensing headband, UMind Lite, integrates Brain-Computer Interface technology, Somatosensory Interaction technology, and Image Recognition capabilities. It charges via USB and requires to be paired with the smartphone app. It works through a combination of EEG, EOG, EMG sensors as well as gyros, accelerometers, and patented components to amplify signal and diminish "brain noise".
