

Ray-tracing coming to older NVIDIA GPUs

NVIDIA announced its ray-tracing tech, only available on its new RTX cards so far, is coming to older GeForce GTX 10-series cards in April. <https://digit.in/apr19-71>

Google Docs to pass notes in class

Teens have reportedly upgraded from passing paper notes to sending digital messages through Google Docs. <https://digit.in/apr19-72>

Zebtronics Zeb Peace

Budget true wireless is here to stay

Truth be told, the Zeb Peace does cut a couple of corners in its build. The tiny capsule that doubles up as the charging case looks glossy but is also one of the most compact pieces we've encountered among budget and expensive true wireless earbuds.

The pods themselves are pretty tiny and only 4 grams each. In fact, the whole package doesn't weigh more than a standard golf ball. The earpods themselves have a glossy finish save for the buttons, which are matte. LEDs on each pod indicates the connectivity and battery status. The buttons require a hard press to be operated. Zebtronics claims they're splash proof. The bass on the Zeb Peace sounds con-

trolled, regulated without any sign of bloating whatsoever.

It even manages to create a decent soundstage on *Hunter* by Bjork.

A hint of roll off does show up when these earbuds are pushed on the highs but stick the volume to about 70% of the maxi-

mum, and you should be able to avoid anything unpleasant. Vocals are also quite accurately handled by the Zeb Peace. They offer a decent amount of passive isolation, even in noisy situa-

tions like daily commute in Mumbai. Call quality is also great, with the only limitation being that it's only pushed to the left earbud. The connectivity is a bit complex but fairly stable.

The Zeb Peace from Zebtronics is affordable, even though it's not the cheapest of the lot. However, that brings on the additional responsibility of performing above average and the Zeb Peace doesn't fail. We had quite a good time listening to our favourite tracks in the gym as well as during commute, which speaks of the earphones' isolation and energy. Battery life is sub-par, the build could be better, but the audio performance carries both of these shortcomings into success. One pair of budget true wireless earbuds? This would be it.

—Arbab Mukherjee

HyperX Pulsefire Surge RGB

Esports-ready mouse

Although HyperX is widely popular for their high performing gaming headsets, their lineup of gaming mice has been decent. With the Pulsefire Surge RGB, the company has managed to build a mouse capable enough to be used for professional esports tournaments. It gets all the high tracking accuracy from the PMW3389 optical sensor under the hood. In MouseTester, it generated a smooth curve but because of the lack of smoothness in the data inputs, it gets a slightly lower score in the Enotus Mouse Test. We had observed the same occurrence when we had tested the Razer DeathAdder Elite and

Basilisk that use the same sensor. However, you won't be able to notice them while using the mouse. It

scores way above our average scores in performance. While the PMW3389 was already an accurate sensor without any problems, HyperX has implemented it quite well.

Coming to the other features, you will find software support using the

HyperX NGenuity. It allows you to play around with the lighting effects to the point of controlling the individual LEDs on the light strips. Macro support is present where not only mouse functions but keyboard functions can be added as well. The ambidextrous design allows for both, a claw and palm grip. It's comfortable for gamers with medium to large hands. We didn't come across any kind of flaws in the mouse throughout our testing. If sensor tracking accuracy matters to you and you also want some RGB bling on the mouse with good software support, then you should definitely go for the Pulsefire Surge RGB.
