

This is how colliding galaxies look like

NASA's trusty Hubble Space Telescope just captured a gorgeous view of two large galaxies that got a little too close for comfort. <https://digit.in/apr19-55>

Venus isn't our nearest planet!

According to a new article, Mercury is closer to Earth, on average, than Venus is because it orbits the Sun more closely. <https://digit.in/apr19-56>

Global Scale: You can launch your developed game smoothly and confidently and bet your business with a reliable cloud infrastructure that is spread across 54 data-centers around the world. Also while mentioning the global scale, it is worth to mention that Microsoft has standalone support for

HOW MICROSOFT IS PLANNING TO MAKE YOUR LIFE EASY

Like any other software development process game development can be divided into mainly two parts. First one is the creation of the software where you design, build, test it. And second one is the operations part where you

monetize your hard work, engage with users, measure the changes and grow the software. Now, as we went through the software that are available in the Game-Stack we can easily see that everything on it is related with some software development state.

Design

So starting with designing aspect of the development you have about four products to help with different scenarios.

1. **Azure DevOps:** A complete end-to-end set of modern DevOps services.
2. **Microsoft Office:** A tried and tested tool for all of your project management needs – Excel to model your game play impact, or Teams to bring together a distributed team with chat, Visual Studio integration and meetings and virtual conferencing – everything is there in their old trusty tool.
3. **Mixed Reality:** Develop VR experiences for a range of mixed reality headsets. Build UWP apps for the

Microsoft Store, or Win32 apps for SteamVR, the choice is yours. Mixed reality also allows you to target both integrated graphics cards or high-end gaming rigs for immersive experiences.

Build

Now after designing the second part is building your application. Building also includes a lot of segments like source code managing to having a good development environment (IDE) to develop on. Microsoft Game-Stack Platform focuses to provide you all of these in once place.

1. **Github:** Recently Microsoft acquired Github and you can fully harness the power of version controlling and management via git and github. GitHub is a development community inspired by the way you work. From open source to business, you can host and review code, manage projects, and build games and software alongside 31 million developers.
2. **Visual Studio:** Everyone who has developed using Microsoft's Visual Studio will definitely mention its ability as a good Integrated Development Environment (IDE). Building your games with DirectX, Unity, or Cocos? Use Visual Studio to create once and publish to 21 platforms, including all mobile platforms, WebGL, Mac, PC and Linux desktop, web or consoles. Use powerful cross-platform tools to make your interactive content run great on any device.

Playfab LiveOps

the Chinese market. They have their own China hosted support and multiplayer services.

Real Time: PlayFab is said to be real-time or near real-time. So you can easily operate your live game with real-time experiences that are unique and targeted. Capturing and giving an audience what they want in a real-time manner provides a unique bond between the user and the company. You can easily monitor player activity and respond intelligently with data driven actions. You can deploy content configuration changes on-the-fly and you can also configure real-time segmentation and deliver custom experiences with player messaging, leaderboards, tournaments and commerce.

Game-Stack is providing you a better plan to grow your business with all the good parts of the software development industry. With the announcement Microsoft is launching a set of services based upon the PlayFab framework to eradicate all the problems that a company faces when creating and deploying games.

Game Stack as a software development cycle
