Activision has announced a multiplayer COD mobile title in conjunction with Tencent. <https://digit.in/apr19-85>

JAXA digs into an asteroid

Hayabusa2 is going to blast a 1 meter deep crater in the Ryugu asteroid to fetch a subsurface sample. <https://digit.in/apr19-86>

Keeping it

We've tried to find ways around the scorching summer since Ancient Rome

Arbab Mukherjee | arnab@digit.in

S

ummer is almost here. In fact, by the time you're reading this, you might already be complaining about the sweltering heat. With it, begins an annual passtime of looking up air conditioner prices, stocking cold water in the refrigerator, ordering ice cream and finding ways to keep your vehicle from overheating, especially on long drives. All of these provisions are powered by cooling technology of multiple types, that have evolved over the years into their current state. While the summer makes its presence felt, let's take a journey across the history of cooling technology.

SINCE ANCIENT TIMES

Home cooling is quite an old practice. Dating back to Ancient Rome, the architectural use of aqueducts to carry

Aqueducts were used in Ancient Rome to carry heat away

away heat from buildings was one of the first ways it was done. However, the earliest known form of refrigeration predates even that. The harvesting of ice and snow for ice cellars and cold storage, mainly to cool beverages, goes as far back as 1000 BC in China and was also seen in Ancient Rome, Greece and Egypt.

Fans, curtains, evaporative cooling and architecture played a major role in keeping houses cool until the reintroduction of large scale air conditioning efforts in the West in the 1800s. We can still see wind columns strategically designed to channel breeze into buildings in Middle Eastern architecture. Ostentatious methods that involved using up large amounts of ice aside, the next major push in air con-

ditioning came with the popularity of electricity. Tesla's alternating current motors made oscillating fans possible.

On the other hand, experimental artificial refrigeration existed before that. As far back as 1755, William Cullen had designed a small refrigerating machine by boiling diethyl ether. Around 1758, Benjamin Franklin and John Hadley confirmed that evaporation of highly volatile liquids, such as alcohol and ether, could be used to drive down the temperature of an object past the freezing point of water. Subsequently, many tried their hand at vapour-compression refrigeration, but weren't successful commercially until James Harrison in the 1850s. However, household refrigeration
