Jetpack Aviation Speeder

Jetpack Aviation's has recently started taking pre-orders for their Speeder flying motorcycle. It looks something right out of Star Wars or maybe even the Batcave. There are four onboard jet turbines that can be powered by diesel or kerosene to push 750 pound-feet of thrust which can move the bike to 150 miles per hour. Depending on the rider weight, Jetpack Aviation also claims a peak height of 15000 feet and a 20-minute runtime. The recreational Speeder will be the first turbine powered, fully stabilized vertical take-off and landing (VTOL) personal aircraft. It also includes 360 degrees automatic collision detection and avoidance system. Jetpack Aviation plans to make two versions of the recreational speeder. The Ultralight Version (UVS) will not require a pilot's license to operate whereas the Experimental Version (EVS) will require one. The base price of the Speeder is an eye-watering \$380,000 which is subject to change depending on options chosen and when it hits the market.

Oceanco Esquel DP153

Recently, custom yacht builder Oceanco unveiled the 105 meters "high-tech go-anywhere" concept, Esquel, named after a meteorite composed of metal and crystals that was found near a Patagonian town. The expedition motor yacht features exterior design by Timur Bozca and naval architecture by Lateral Naval Architects. A displacement hull with a plumb bow forms the structure that is designed for extensive cruising in remote, harsh locations. The onboard diesel-electric propulsion system allows some impressive performance numbers. The Esquel can reach a top speed of 16.5 knots and a cruising range of 7000 nautical miles at 13 knots. The 345-foot long yacht will feature a number of communal spaces, both inside and outside. Some of these will be capable of transforming into cinema or game rooms. Passengers will also have access to a spa and wellness area, including a gym, yoga room and hot tub. It also features infrastructure for home-schooling. The Esquel also comes with a 2500 square foot garage that can house RIBs, tenders, water-sports toys and more. With a goal to explore remote areas of the planet, the concept yacht is capable of carrying and launching two submarines, motorbikes, a land vehicle, and can even accommodate a helicopter.

Freak NeXt by Ulysse Nardin

Swiss watches are all about tradition. Perhaps in a bid to stay relevant with the times and trends, watchmakers have started to make one-off special editions of their watches, a behaviour also seen in the auto industry. These special timepieces are usually packed with cutting edge features and experimental ideas that later move on to the mainstream. The Freak NeXt from Ulysse Nardin is a new addition to this genre and before you ask about the price, let us tell you that it is just a concept watch and not for sale.

Let us get down to the technicalities. The movement is powered by a flying oscillator with an entirely new multilayer 3D construction incorporating silicium blades. The design features an oscillator that levitates without the

need for a balance cock, which removes the need to have pivots and jewels, which, in turn, reduces friction and enhances the timekeeping. It also contributes to the 70-hour power reserve that the watch boasts. The futuristic aesthetic of the watch is in tune with the technical advancements it packs. With platinum and titanium in the encasing, while the movement features a trapezoidal-shaped bridge inspired by spaceships in the Star Wars universe. Four luminescent tubes filled with Super-LumiNova lend the timepiece a trippy phosphorescence only visible at night. According to Ulysse Nardin, there are 32 silicon blade springs making 16 triangles in four separate layers, with a frequency of 12 Hz. The fast rate makes this one of the most animated Freaks since the first one in 2001.
