WHAT'S NEW

Apple and Qualcomm settle patent disputes

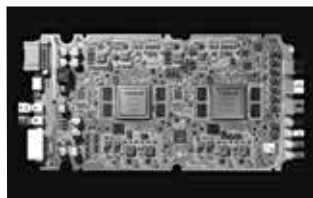

Apple and Qualcomm have settled their patent dispute which has been going on for about two years now. The two companies have been battling each other in courts in Germany, China, USA and many others. As part of this settlement, the companies have also formalised a six-year licensing agreement along with a multiyear chipset supply agreement. Analysts say that the need to incorporate 5G chips into their smartphones is what led to Apple coming back to the negotiation table. Immediately after this announcement, Intel announced that they were exiting the 5G mobile modem

sector. Intel's 5G modem which was scheduled to launch in 2020 has been cancelled as well. Apple had been using Intel modems in some of their smartphones since the iPhone 7. However, telecom service providers could opt to sell only Qualcomm enabled iPhones as Verizon and Sprint were in the US. It is unclear if there is an exclusivity agreement. It seems like Qualcomm will grab the lion's share of the market followed by MediaTek. <https://digit.in/AplQlcmBros>

Tesla drops NVIDIA and moves to its own AI chip for self-driving cars

At the Tesla Autonomy Investor Day, CEO Elon Musk announced that Tesla will be using their in-house designed self-driving computers instead of the NVIDIA based solutions which were being used until now. Dubbed the FSD chip, Tesla claims that it is 21 times better than the NVIDIA DGX processors and is thus, "the best chip in the world ...

by a huge margin". NVIDIA soon released a statement about Tesla's claims that, "Tesla was inaccurate in comparing its Full Self Driving computer at 144

TOPS of processing with Nvidia Drive Xavier at 21 TOPS. The correct comparison would have been against Nvidia's full self-driving computer, Nvidia Drive AGX Pegasus, which delivers 320 TOPS for AI perception, localization and path planning." Tesla's FSD chip sits at the heart of its self-driving computer named Autopilot v3.0.
