

SECURITY WATCH

2018 in Cybercrime: \$2.7billion in losses

A recently released report from The FBI's Internet Crime Complaint Center (IC3) reveals that they received 351,936 complaints of Internet-related crimes and scams that amassed some \$2.7 billion in financial losses. Among the reports, the most common ones were non-payment/non-delivery scams, extortion, and personal data breaches, with the most losses to business email compromise (BEC), romance fraud, and investment scams. Individuals above the age of 50 were the most targeted demographic. There's a positive thread to the report as well - the IC3's new Recovery Asset Team last year was able to retrieve \$192 million in losses to scammed businesses. Recovery was assisted when the victims contacted their bank and relevant authorities almost immediately upon knowledge of the scam.

MOBILE WATCH

DOOGEE S40

DOOGEE has recently announced another addition to its rugged series of phones with the DOOGEE S40. The phone sports a metal body and has two vertically aligned cameras at the back, with a fingerprint scanner right below them. The IP68 certification is boldly advertised on the back as well, and it also sports the IP69K certification. As a part of the "micro drop test" the phone has been dropped 20,000 times on six sides. In addition to that, the phone has been dropped from 1.21 meters from 26 different angles. They also claim that the S40 can survive up to four hours at 60 degrees Celsius, and 24 hours at -30 degrees Celsius. It is powered by a quad-core processor by MediaTek, the MT6739 and a 4650mAh battery.

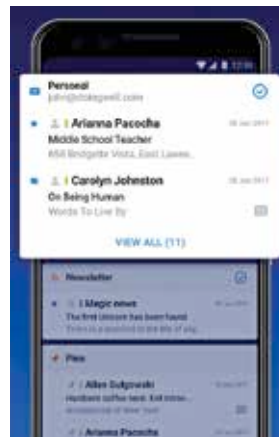

APP WATCH

Spark

As Google recently killed Inbox, many users were looking for an alternative that had its handy features. In a curious case of perfect timing, Spark made the jump to Android offering all that and more. The design takes a lot of visual cues from Inbox by grouping together emails in pre-determined segments. It also ditches the tabbed view for the list view, offering you (almost) all emails at the same screen but in a highly organised way.

It is the features game where things get interesting. Spark supports searching for attachments in many specific ways, including contact-specific searches. In fact, the app allows you to use natural language queries so that you don't have to bother about highly-specific search keywords. You can schedule emails, and also set reminders and snooze the ones you've received. Customisation is the focus here, as you can tweak the sidebar and the widgets as you see fit to get the best experience out of the app. The developers have also confirmed that

Dark Mode is on the way in a future update.

The Spark app also allows you to collaborate with teammates on shared drafts which works alongside the 'Teams' feature. This might be highly useful when you need to work together on an email before sending it to a client/boss. You can also customise any of the four available swipe options

to make the most out of gesture-based interactions. Overall, Spark proves to be a solid alternative for those feeling abandoned after the death of Inbox, especially after a few future updates.

Zoho Show

This is a presentation app that supports PowerPoint files and has modern features such as cloud

support, team collaboration, and Wear OS compatibility.

Download Navi

Download Navi is an open source, free and ad free download manager. The app does the basics right and

since it is open source, you can contribute to the project as well.

Swoot

This new app turns the podcast experience social by allowing you to see what your friends are listening

to. You can also see the shows and episodes recommended by them.
