settings, it'll probably end up being limited at 200-300 FPS. That's the ceiling for optimisation for current gen video game engines. On the other hand, if you were to take an older video game such as Quake then you'll experience some absurdly rapid movements and odd physics in the game. In fact, you have to limit the FPS of such older games to enjoy it properly. This is because games back

then were very optimised owing to the fact that CPU resources were extremely scarce. Couple that with whatever CPU performance improvements have been achieved and you have extremely high frame rates.

While I'd certainly want a massive display with a high frame rate to ensure better immersion, I know for a fact that there's going to be a ridiculous amount of stuttering in the game.

Which is why I'd rather have a 1080p 144 Hz adaptive-sync display. This way, I will have a smooth experience with no frame tearing and should games improve in the future, my display will be more than capable of rendering however high FPS the game may provide. I'd prefer a smoother experience at high settings rather than have a high resolution display with a garrish picture quality.

BUYING ADVICE

STICK TO A SMARTPHONE

Q Sup Agent001, Few weeks ago, I got interested in something called product photography so I started researching about it from here and there and that's when I realised I was missing the most important ingredient A CAMERA!! So I took

You could shoot this with a smartphone

up the quest of finding a budget DSLR camera (since it's my first time) but couldn't find anything good as I'm new to the click-click world of cameras. So I thought maybe you could help me out with it. I have no specific budget in mind but tryna keep it low.

Thanks.

—Aadit Maan Singh

A Hi Aadit, Since you mentioned that you'd like to keep it less, what if I told you that you weren't actually missing the most important ingredient at all? In fact, if you have a good smartphone, then you're set to begin your product photography journey. You might want to check out some of the advanced camera apps such

as Open Camera app which opens up a myriad number of features related to the camera which can really put some of the entry-level DSLRs to shame. Before you do that, check if your smartphone actually supports Camera API2, which allows apps to access the advanced features on your smartphone. There are apps such as Camera2 API Probe. If the row named Hardware Support Level indicates 'FULL' then any camera apps you install will have complete access to Camera2 API and you can really take some amazing shots with it. Check out some LED lights and a lightbox to add a professional touch to your photos. Once you've exhausted the capabilities that a smartphone is capable of providing, then upgrade to a DSLR. When you add motion to your subject then smartphones might end up being a limiting factor. Also, the optical zoom offered by a DSLR is far superior than whatever your sub-30K smartphone can provide. In most cases, once you've mastered the smartphone and wish to upgrade, it's quite likely that you'll want to upgrade to a mid-range DSLR such as a Fujifilm X-T3 or a full-frame Sony/Nikon/Canon DSLR. You wouldn't want an entry-level DSLR at that point.

NEED AN IP CAM

Q Hey Agent001, When I went to my native place (about 400 KMS away from my apartment), My apartment was robbed!!! So I need to buy a good CCTV camera

strictly under ₹5,000. I'm ready to go with your advice.

—Subhabrata Das

A Hi Subhabrata, Most IP cameras these days come with a subscription service that allows you to upload a few days worth of footage directly. They also have motion detection so the moment there's significant movement such as when an unexpected visitor pops in, it will automatically start recording. Unfortunately, this comes to a stop if you have a power cut. So you need an IP camera with motion detection, battery backup and a subscription. You can get around the battery backup by getting a camera which needs a 5V input. This way you can hook up a power bank and then connect the power bank to wall power. If your power bank is cheap then there's a good likelihood that your power bank might catch fire if it's kept plugged in for charging 24x7. All of these are premium features that cost a bomb. The only way you can keep the price low is by hooking up a webcam to a

NETGEAR Arlo Go

computer and getting a motion detection software. Most webcams come with a motion detection feature so simply set that up or get a solution such as 'Webcam monitor' and the configuration is fairly straightforward. You can even setup the software to send notifications if any movement is detected. If you are serious about security, then check out a proper security solution such as the Netgear Arlo or Godrej Ace.
