Teardown: AirPods 2

A more durable repair nightmare

Arnab Mukherjee | arnab@digit.in

A fresh brain

The second generation AirPods feature Apple's new H1 chip which is responsible for better connectivity, Bluetooth 5.0, lower latency in gaming and voice-activated Siri functionality. There's also '1.5x faster connection time for phone calls', which again hints at lower latency.

Sealed shut

Getting the AirPods to open up remains excessively difficult. It requires heat, careful scalpel work and an isopropyl alcohol bath to get it to reveal its innards. Without extreme care, it is easy to damage it irreparably right at the beginning.

Wireless charging coil

The wireless charging coil is firmly planted to the bottom of the case and comes with a thermal pad to keep it cool under pressure. It is not possible to extract this without damaging the component itself, so forget about any DIY repairs.
