

B&O Beovision Harmony

Luxury comes at a price, and B&O is new to neither of those things. The Beovision Harmony is a new television for your home that can double up as a piece of art. The new TV comes with rotating speaker panels that, according to B&O, turn your TV into a sculptural object in your living room. When the TV is off, or when you're using just the speakers, the TV sits low and concealed behind the

folded speakers. When the screen is turned on, the TV is raised and the speakers 'fan outward' until the TV is fully raised and the speakers are beneath it. The TV is a \$6000 LG C9 OLED, with the speakers housing a three-channel, fully active DSP-based sound system. The system can connect up to eight Beolab speakers. There's a growing trend of turning the TV into an integrated design element in the house. It will be available in October 2019 and can be wall mounted as well.

Price: \$20,000

Zenith Defy Inventor

The Defy Inventor brings the landmark Zenith Oscillator beyond its limited edition existence. First unveiled a couple of years ago in the experimental Zenith Defy Lab, the oscillator comprises of a large silicon frame that doubles up as the balance wheel, hairspring and lever and uses silicon to regulate the movement at a high frequency. However, the Defy Inventor has an improved oscillator that implements a silicon escape wheel with split, flexible teeth. The frequency has also been pushed up to 18Hz, which is equivalent to 129,600 vibrations per hour. This is roughly six times that of an ordinary movement and comes at the cost of about 10 hours of usage. The bezel on the inventor is made of Aeronith, a porous aluminium composite, while the rest is made of lightweight titanium. This watch holds promise for future Zenith timepieces being able to overcome most of the factors that hold back typical movements.

MB&F Medusa

We do cover wristwatches in this section quite frequently, but clocks haven't been regular features here. The MB&F Medusa makes a case against that by the sheer design ingenuity that has gone into it. In their 10th collaboration, MB&F and L'Épée have combined craftsmanship and art to create this one of a kind dual configuration clock inspired by a jellyfish. Yes, you read that right. With hand-blown Murano glass forming the housing, and Swiss clockwork

engineering under the hood, each of these timepieces boasts a 2.5-Hz (18,000-vph) movement with a seven-day power reserve. The goal of this timepiece was to evoke the softness and fluidity of a jellyfish despite being a solid, functional clock. Thanks to the glass, the Medusa weighs in at about 6kg. The movement has been designed to aid one-handed operation and to also resemble a jellyfish's central nervous column. The 155-part, 23-jewel movement is protected by an Incabloc shock protection system, while the metal surfaces are finished in Geneva waves, anglage, polishing, sandblasting, circular and vertical graining, and satin.
