iTENG Pacemaker

Pacemakers are medical devices that are used to help a patient's heart beat properly. However, they run on batteries, meaning you'd need to swap them out every now and then to keep the pacemaker going. Forgetting to do so might end up being a costly mistake.

Researchers from China and the U.S might have found a solution to this problem though. They've developed a battery-free pacemaker, which gets its power from the energy of the

beating heart itself. While it isn't yet ready for use on humans, it has successfully been used and implanted in pigs. Why pigs you ask? Because pig hearts are approximately the same size as human ones.

In the iTENG demonstration, it was shown that its energy output was enough and more than needed from a commercial human pacemaker. So the idea of a self-powering pacemaker isn't unfeasible.

Astell & Kern Kann Cube

Whe Kann Cube portable music player is the successor to Astell & Kern's popular Kann. What makes the Kann Cube, or even the Kann for that matter, stand out compared to other hi-fi portable music players is the size of its battery. While the Kann had an already impressive 6200mAh battery, the Kann Cube comes with an even bigger 7,400mAh battery, which promises up to nine hours of non-stop FLAC playback.

In addition to that, the Kann Cube comes with two ESS ES9038PRO Sabre DACs, 128GB expandable storage, a new quad-core CPU to address the Kann's somewhat sluggish interface, and USB-C fast charging. The 5-inch display sports a 720p panel. Also, the Kann Cube natively supports Tidal, an online High Fidelity music streaming service.

Because of its mammoth battery, the Kann Cube is noticeably bulky, and weighs almost half a kilo, which seems to be the only con.

Mandalaki Birò 02

The Birò 02 is a concept all-electric car based on the Estrima Birò, four-wheel, all-electric city car. The difference between the two being that the Birò 02 is made out of 80 per cent recycled plastics.

The Birò is a two-seater sold in Europe which is really small. Small enough to fit in scooter parking spaces. The Birò 02 has a driving range of 62 miles per full charge and at a top speed of approximately 64 kph. It comes with a removable battery, with its own case that has wheels. This allows owners to pull the battery inside for charging.

Mandalaki grinds plastic waste into a fine powder, this powder is incorporated into the molding process of the Birò 02. The concept Birò 02 is expected to go on sale as soon as July this year.
