

Urban Rivers Trashbot

Trashbot is a creation by the Chicago-based startup Urban Rivers, which was created in order to clean up the Chicago River. The Trashbot looks uncannily like a small unmanned raft, and to an uninformed outsider, resembles a water Roomba of sorts. This tiny bot slowly snakes around the Chicago River while vacuuming up all the scraps and dirt it comes across. However, while the Trashbot does appear autonomous or self-driving, it actually isn't. The Trashbot could actually be under the control of just about anybody in the world who has an internet connection.

That's right, anybody with an internet connection would be able to log onto Urban Rivers' site and take a turn at controlling the Trashbot, for two minutes. After the Trashbot has picked up a sufficient amount of trash, the idea is to dump the trash at specific collection points on the river bank where they later be picked up. This is quite an inventive way to clean rivers and lakes.

Mitsubishi TO-ST1-T

If you follow Japanese pop-culture, especially anime, then you probably know the significance of toast. For some reason, they're apparently obsessed with it. So, it shouldn't come as a surprise that the Mitsubishi Electric Corp has come up with a toaster to do just that, create the perfect piece of toast.

The Mitsubishi TO-ST1-T bread oven toasts only a single slice of bread at a time, but the guarantee is that it will be toasted to perfection. The TO-ST1-T doesn't really look like a conventional toaster either, it actually kinda resembles a *chapati* maker, but instead of being flat on both sides, it's hollowed out to fit a single slice of bread. It's not a tight fit, and they've incorporated room for if you want to put eggs or cheese on toast for some french toast.

Asus ZenFone 6 flip selfie camera

Phone companies are constantly coming up with some new and wacky ideas to get rid of the abhorrent notch. So what is Asus' solution for the notchless challenge? Well, it's quite smart actually. They've got just the one primary rear camera module, which flips 180 degrees to serve a selfie camera as well. Yep, you read that right.

If the reports are anything to go by, the Asus ZenFone 6 has two very normal looking back cameras. However, when you want to take a selfie, the whole block just flips vertically upwards, 180 degrees, to

look at your face. We don't really have too much information about this mechanic, but it sounds pretty cool. It feels like an inventive way to avoid the notch, even though it is not the only phone to apply this method (Samsung A80 has a similar approach).

Discounting the fancy flip camera, the ZenFone 6 is pretty beefy, with a 6.3-inch (2340x1080) OLED display, a Snapdragon 855 processor, with 4, 8, and 12GB RAM options, and 128, 256, and 512GB storage options. The main camera sensors are 48MP and 12MP, which of course, double as selfie sensors as well.
