

Kotlin for app development

Google announced that Kotlin is now their preferred language for app development. <https://dgit.in/june19-17>

Enemies no more

Windows 10 will soon begin shipping with a built-in GPLed, open source Linux kernel. <https://dgit.in/june19-18>

UI DESIGN FOR INDIA

Successful apps in India are adapting themselves to the habits of local users.

Aditya Madanapalle | aditya@dgit.in

In India, there are certain unique criteria for making apps successful. The app has to be lightweight, and should work easily on spotty 2G networks. This is why major companies such as Facebook, Google and

Microsoft have launched "Lite" versions of apps. The applications cannot be demanding considering that most users have entry level phones. Developers now have the ability to collect a lot of feedback about how end users are navigating their applications. This allows developers to modify and extend the UI, based on the needs and habits of the users.

TESTING

One of the best ways to ensure that the application is being used as intended, is rigorous testing. Avinash Saxena, the cofounder of Roposo, a local social entertainment application, explains the approach, "Testing the design with

some users and collecting feedback has become important as it gives us the idea of how the user is responding to the design and experience, where the user is facing the problem and where the user is getting blocked. Typography, padding, buttons, elements, proximities are some of the major design wings which make the user feel complete while using the product." Testing outside the office allows application developers to understand how the app will be used in the real world. UX personalisation is a new approach, where the app tracks the activities of a user, and serves the users content that is relevant to them. Personalisation is not just customisation, but
