

Nebra AnyBeam

Funding: US\$ 66,551 pledged of US\$ 52,222 goal

Link: <https://dgit.in/AnyBeam>

The Nebra AnyBeam is marketed as the world's smallest pocket cinema projector and it is available in four different variants, one of which even includes a board for Raspberry Pi. The AnyBeam sports a smaller form factor in comparison to other projectors that boast a similar form factor, however, the picture it emits can go up to 150 inches in size with perfect sharpness, according to Nebra. The AnyBeam also sports a laser projection module which eliminates the need for fans to keep it cool, eliminating most of the sounds and allowing for a more immersive cinema viewing experience. It also has MEMS technology which keeps the picture in focus automatically. This technology also eliminates the need for bulbs or LED lights and is rated at 30 ANSI lumens, which is reportedly on par with 150 lumens of a standard DLP projector.

The lightweight device at 140 g has the ability to connect to any smartphone, laptop, computer, tablet, Chromecast, Fire TV Stick and most importantly HDMI. It features a 1 W speaker as well as the more convenient 3.5mm headphone jack which allows private viewings. The device also supports attaching a tripod with a screw thread. Power consumption is quite low and is reported as being around 3 W. The standalone variant of the AnyBeam is priced at \$285 while the Monster Ball variant goes as high as \$325 on Kickstarter.

MetaFly

Funding: US\$ 666,173 pledged of US\$ 33,618 goal

Link: <https://dgit.in/MetaFly>

Metafly is yet another drone that draws inspiration from insect anatomy. With wings and body designed like the body of a moth, the MetaFly replaces the traditional rotors quite efficiently allowing accurate navigation with a dedicated remote control. The specifications on this tiny, lightweight drone are quite impressive. It has a wireless range of 320 feet and can go as fast as 18 kmph. Additionally, the manufacturers also claim that the MetaFly is crashproof owing to an elastic helmet, legs and wings. However, this design seemingly sacrifices some of the flight stability in favour of insect wings that can easily fly longer distances without too much effort in comparison to traditional rotors.

This design is increasingly getting popular since it enables better takeoff, more efficient mid-air control and higher speeds in comparison to traditional drones. One major drawback of this design is the fact that it is more difficult to fly in less than ideal weather and strong winds that easily derail the MetaFly's flight path. The MetaFly's battery life is rather negligible with an estimated time of around 8 minutes per charge. The device itself takes 12 minutes to fully charge. However, it hosts one little cool trick up its sleeve. The MetaFly can be charged while it is flying by connecting it to a powerbank or a remote control. It is priced at \$89 on Kickstarter.

VEZO 360

Funding: US\$ 477,584 pledged of US\$ 25,000 goal

Link: <https://dgit.in/VEZO360>

The VEZO 360 is advertised as the world's smartest dashcam made by a Korean startup

company, ArVizon. The VEZO 360 is able to track the driver's level of drowsiness and send corresponding alerts of varying intensities. The device utilises internal AI machine learning to promptly and accurately detect drowsiness in drivers, which is known to cause a significant number of road accidents. The VEZO 360 is the world's only dual-lens dashcam which can shoot 4K video in 360 degrees. It also works as an action cam and supports 4G LTE connectivity. 360 degree dashcams like the VEZO 360 provide important evidence in case of a crash and even act as a crime detector and in some cases, deterrent.

It features proprietary technology that constantly tracks the drivers eyes and mouth to look for telling signs of drowsiness. The device is also capable

of making out number plates and other details at farther distances which can prove useful in case of accidents or thefts. The device supports mobile internet connectivity, WiFi, Bluetooth, GPS and even comes with a mobile app. Each of the two cameras feature an f/2.0 aperture and 180 degrees field of view, thereby eliminating any blind spots. Additionally, the device is magnetically mounted in the car and can be removed easily to be used as a live action cam by mounting it on a tripod. Emergency footage, like an accident or theft, is uploaded to the cloud directly. Vezo sends a notification to the user's phone, which is connected by Bluetooth, in case of suspected foul play. The device is feature-packed and priced at different price points starting at \$149.
