

18 CAMERA APPS THAT MAKE YOU A SOCIAL MEDIA STAR

01

ADOBE PHOTOSHOP EXPRESS

The mobile version of Adobe Photoshop is just about the most powerful and versatile image editing app. The app allows users to work with high quality raw images, and also supports the TIFF format. Professional photographers will love the ability to add a custom watermark to their images. The app connects to Creative Cloud and Google Photos, so you can seamlessly move photos from your phone to your computer.

02

BEAUTYPLUS

This beautification app is higher rated than even FaceTune 2 or B612. This is because of a comprehensive list of features, as well as an easy-to-use interface. There are a number of retouching options, a tone slider and a contouring tool to adjust the shapes of features. Once an image is captured, you can add make up, and even dye the hair. There are also stickers, fx brushes and AR filters.

03

CA-MERA

This is a camera app processes images using cellular automaton, which involves providing a set of rules to a grid, with any information in a single pixel triggering a change in the brightness levels of the adjacent pixels, which then cascades across the image. The app takes black and white photos only, and users can tweak the amount of pixelation. The end result photos are very different and unique.

These applications will allow you to post unique looking images that will help your photos stand by a mile out in cluttered social media feeds.

04

CINEMAGRAPH PRO

Cinemagraphs are a bit of both, images and videos, which are shared as gifs where a small portion of the image sees repeated movements. Cinemagraph Pro makes the production of these cinemagraphs very easy, by using a tool that detects motion as you mask portions of an image. The resulting cinemagraphs are very high quality, and can be exported in 4K, in H.264, HEVC, Live Photo, and GIF formats. A tripod is highly recommended for using this app.

05

COLOR SPLURGE

This app highlights particular colours while making the rest of the image black and white. Users have to selectively paint over the portions of the image that they want to retain the colour of, which gives users a lot of control when it comes to highlighting portions of the image. The application can also be used to change one colour to another.

06

DARKR

This is an application that simulates a dark room, and allows you to tweak the exposure, contrast, shadows and highlights of an image as if you were using a dark room. You can also add grain to your photos. There are

burning and dodging tools available to lighten or darken portions of your images. The images are in black and white, which is great for portraits. However, the photos can be adjusted using simulated chemical toners, which are Selenium (purple), Cyanotype (blue) and Sepia (brown).

07

HUJI

Huji is another one of those apps that gives your images a nostalgic effect. The experience is carried over to the actual act of shooting, as the interface looks like one of those cheap point and shoot film cameras. There is a tiny viewfinder in the corner, and you have to “develop” an image after it has been shot, during which a random filter is added, which simulates damage to the film or light leaks. Huji also adds a timestamp to the image - for the year 1998.

08

HYPERLAPSE

Hyperlapse is an app from Instagram that allows you to take steady timelapse videos. There is some clipping along the edges, but the resulting videos look like they have been shot on a tripod or a steadycam rig. You can adjust the duration of the hyperlapse after you have shot the video as well. There is also a Hyperlapse app from Microsoft.
