

09 HYPERSPEKTIV

This is an app that is very good at giving you a fresh perspective of the mundane world around you, with a set of psychedelic filters. While users can preview the filters in real time, there is also a wildcard mode, and users have the choice of creating and saving their own filters. This app is really good for taking creepy or scary photos as well. The application has been getting a steady stream of trippy filters, so investing in the premium version is worth it.

10 NCEPTION

This application lets you shoot videos of the real world that look like something out of Inception or Doctor Strange. Essentially, the image is mirrored along many axes, with two or more virtual mirrors placed on the image. The image stabilisation is also really good, but the application does not work very well if the brightness changes by too much over the course of the video. Users can combine Nception with other apps such as Hyperlapse for maximum effect.

11 NOMO

This application simulates the images captured by particular cameras, including the Leica M3, the Nintendo Game Boy camera, the original 2007 iPhone, or the 1840 Petzval lens for that swirly bokeh. Most of these cameras are available with a pro subscription which costs ₹1,649 per year, although you can purchase a few cameras individually. However, the images do take some time to develop for some cameras.

12 NIGHTCAP

This is a must have application for shooting long exposures at night. A tripod or other gear (such as star trackers) is absolutely essential for using this application. Nightcap is a stargazer's companion as there are dedicated modes for capturing star trails, as well as meteor showers. An external battery pack is recommended as there is no real upper limit for how long the "shutter" remains open. Nightcap can

also be used for taking milky waterfall images with the Moon as the only light source.

13 PIC JOINER

This is the application to use if you want to make collages. There are an ample variety of options available on the free app, but you can pay to get access to more frames. However, the free frames should be enough for most use cases. The app is particularly useful for sharing contrasts, parallels and comparisons on your social media feeds. The interface is simple enough, just select a frame and the images from your camera roll to fill the different portions in. You can adjust the zoom and positioning of each image.

The nception app

14 RETROCAM

RetroCam is another app for giving a vintage look for your images, but where this app stands out is giving users a lot of control over every aspect of the look. The effect is applied to the image in a number of layers. The filter layer changes up the colours and tones of an image. The overlight lets you pick a particular light leak. The textures allow you to choose from a lineup of dust and scratch options. There are paid options as well, which allow you to add glitch fx and a datestamp.

15 SLOW SHUTTER CAM

This app allows you to capture incredibly long exposures, and the manual mode has no upper limit. There are three modes,

one for capturing motion blur, another for light trails, and a third for low light conditions. You can also adjust the light sensitivity while capturing. One feature that makes the app incredibly powerful and versatile is the ability to pause and resume a single exposure. The app also has an intervalometer, which allows you to open the shutter after a preset amount of time.

16 SKRWT

When you capture images of buildings from the ground level, the corners on the top of the buildings are closer together than the bottom. Similarly, if you are capturing a skyline from a high rise, the tops of the perspective means that the tops of the buildings are wider than the bottoms. Skrwt is an app that corrects the distortions because of the perspective or the types of lenses used. The correction is automatic, and there is an incredibly intuitive manual correction tool as well.

17 SNAPSEED

This is a deceptively simple application, that at first looks like it is just providing another set of filters. While the filters themselves are a refreshing change from Instagram, Snapseed really stands out because of its toolkit. This is an incredibly powerful set of tools to tweak almost any aspect of the photo, including lens blur, white balance, and details. There is a lot you can do with this app, and fortunately there are a number of tutorials included to get you started.

18 STORYZ PHOTO MOTION

StoryZ Photo Motion is yet another app that will allow users to produce cinemagraphs, but this app stands out since it gives them a number of options to play around with, after the image has been shot. Users can add animated ripples to portions of the image, which are great for water or smoke. Users can also overlay a video or effects to parts of an image, such as adding fire to a sword. Additionally, the backgrounds or certain portions of the images can be replaced with a video as well. 📺
