

18 SOFTWARE WE WISH WERE AVAILABLE ON OTHER PLATFORMS

There's an app for everything ... or so we thought.

Mithun mohandas | mithun@digit.in

This story was an uphill task from the get go since you do get apps for practically every usage scenario possible. So we had to donn our thinking caps and come up with practical as well as absurd scenarios for which an app doesn't exist.

PC APPLICATIONS WE WISH WERE ON SMARTPHONES

01

ONE TRUE MEDIA PLAYER

MX Player comes really close to being the equivalent of Media Player Classic on smartphones, but they had issues with AC3 a few years back and the only way around it was to use a third-party codec. What we need is a player that allows you to tweak every aspect of video playback and can play all the codecs under the sun.

02

SOCIAL GAMING

Gaming is fun, no matter what the platform. But it's even better when you have friends to play with. On the PC, you can use Steam or Discord to not only own a massive library of games but also have fun with your friends. Google Play Games can be best described as a basic score board. What we need is a platform with the social aspects of Discord and the game library of Steam.

03

PHOTOSHOP

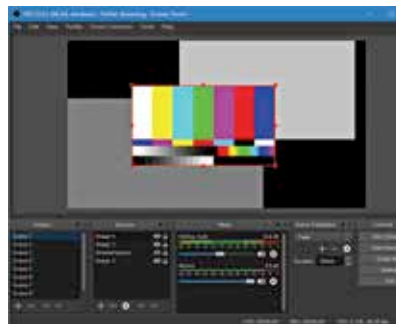

Yes, we know Photoshop Express exists, as do Pixlr, Snapseed and a billion other apps. How-

ever, once you get used to Photoshop on the PC, every app pales in comparison. Layers, zooming to pixels, etc, is stuff we want to do on our phones as well.

04

OBS STUDIO

Do you enjoy live streaming? Or subjecting your friends to your superior gaming skills on Facebook, Twitch and YouTube Gaming? Well, it's a pity you can't easily do the same for your bada\$\$ mobile gaming skills as well. While OBS on PC has superb plugins and on-the-fly modifications, smartphones are limited to switching streams on/off, or switching the camera.

OBS Studio

05

WIRESHARK

If you want to capture smartphone web-traffic data, you will need to hook it up to a PC with the Android SDK installed and then use androiddump. There's no simple way to isolate apps or network interfaces and examine packets closely.

06

VIRTUAL MACHINE

Usually, if you want to run Android apps on your PC, you have to install an emulator. However, we'd like to go the opposite way and have a virtual machine running on Android. Mobile SoCs are very powerful and flagship smartphones do come with 12 GB of RAM these days. Imagine running an Android VM on an iPhone, or vice versa, or Windows 10, for that matter...

07

ANDROID STUDIO IDE

If you're a programmer, you've probably just done a spit-take. But hear us out. As silly as it sounds, smartphones are turning into mobile offices and getting something that can code on the go would be of great help. The compiler task might have to be offloaded to the cloud, but tweaking code on the go seems like a good enough reason to warrant having Android Studio on Android.

08

LIVE LINUX

Everyone of us has had to resort to Linux one time or the other in order to troubleshoot their PCs. Often, we'd use a Live CD/USB to perform a data backup after
