

an OS crash. In Android's case, there's little you can do other than flash an OS image all over again, or spend ridiculous amounts of money for a professional data recovery service. If only we could run a basic live linux distro on your smartphone...

09

DISTRIBUTED COMPUTING

Distributed computing software such as Folding@Home have had an enormous impact on biomedical research. Scientists have gained new insights into diseases

For a better world

such as Alzheimer's, Cancer, Huntington's, etc., because of projects such as Folding@Home. Folding@Home was present on Android but has now disappeared because the primary developer stopped working on it actively. It's time someone else steps into those shoes.

10

SECURE ERASER

While there are apps that allow you to securely erase portions of your smartphone storage space, they are limited by the fact that apps don't get access to all off the storage space on your phone. You're never going to end up corrupting Android by deleting a system file the way you can on Windows. While this does sound like we're shooting ourselves in the foot, we do believe that in order to actually "secure erase" your phone, you should have access to *everything*.

11

SYSTEM PACKAGE UNINSTALLER

One of the first things you do when you get a new laptop is to remove all bloatware and unwanted software that comes pre-installed. This is quite simple on PCs, but with Android you have to either root or use

a specialised tool that is tailor made for just a few smartphone brands. There's no "Add or Remove programs" tool that gives you total control over third-party and hidden apps.

12

INTER-IM MESSAGING

The problem with today's smartphones is that there are way too many messaging apps. You have WhatsApp, Facebook messenger, Instagram (not a proper messenger but it's used as one anyway), Telegram, imo, WeChat, QQ, Discord ... the list goes on. What you need is an app that can gather messages from all apps installed (with your permission) and aggregate them in one place. This would make life way simpler and you wouldn't have to install and deal with 50 billion notifications everyday.

13

INDESIGN

Ok, this one's sort of an internal joke since we use InDesign to make this magazine for you. Being the lazy bozos that we are, we like to work on the magazine from the comfort of our homes and sometimes, from the comfort of our bed. So much that we don't even feel like getting up and walking to our PCs. If only InDesign were present on our phones ... *sigh*

Can we get this, like right away?

14

TITANIUM/NINITE FOR iOS USERS

This one's for our iOS users who might be feeling left out at this point. If you ever switch to a new phone, you have to waste a lot of your precious time in re-downloading all your apps. However, if you happen to be on Android, you can use Titanium Backup or you can use Ninite on Windows to create a package of all your apps that can be installed at one go. iOS does not allow installing apps from

third-party sources unless Jailbroken. They might get a few converts from Android if they had this feature. There's AppValley, but it uses tweaked apps.

ANDROID APPS THAT WE WISH WERE ON PC

15

INSTAGRAM UPLOADER

For Jeebus's sake, can we have an Instagram photo uploader for Windows already? The platform has been around for ages and it's yet to get an uploader for Windows. We're certain that millions of Instagram users would be more than happy to pay for such an app or feature if need be.

16

S.M.T.H.

You've had it on your phone and perhaps, you've even lost a phone to this app that wants you to throw your phone up into the air, as high as possible. Now imagine all the fun you'd have if it made its way to your PC. We can't help but laugh ourselves silly at the prospect of having to fling laptops and massive desktops up in the air and try not to drop it. Lot of guaranteed fun and lots of monies lost to silliness.

17

NOTCH

For folks suffering from FOMO on the whole phone notch trend had this app come to their rescue. It allowed you to put a notch onto your notch-less screen. Some of us feel that the notch was a courageous ... scratch that ... It was a silly concept. And more of us believe that apps that let you put notches are all the more stupider. To drive the point home, we'd like it if there was a program that put up a massive black block on your PC screen.

18

A BETTER VOICE ASSISTANT

We honestly don't know anyone who uses Cortana for everything. On the other hand, Google Assistant and Siri are commonly used on their respective platforms. While we don't see Apple making anything for any platform other than their own, Google could very well come out with an application that enables Google Assistant on the PC.
