

07 E-CIGARETTES

Sure they're being used to wean people off cigarettes, but on the darker side of things, turns out, they're getting kids hooked to nicotine. Whoops! Vapes and e-cigarette companies were found to be actively advertising their "cool" products to kids on Instagram. Talk about backfires...

08 3D-PRINTING WEAPONS

3D Printing is being used for good around the world. 3D printing organs, limbs for the disabled, bakers using it to print cakes! It's crazy. Unfortunately, it can also be used to 3D print guns. And these guns can actually get by unnoticed without detection through most scanners. Scary.

09 TOR

The Tor Network, short for The Onion Router, is used to browse the interwebs undetected, or anonymously, so that you can protect your privacy from prying eyes. That's great, winning the war against Big Brother and all, but it is the network of choice for criminals as well!

10 WINDOWS 8

It was hard to pick between this and Windows Vista. You see, Vista had its heart in the right place. Sure it was annoying, but it wanted to provide more security and laid down the framework for Windows 7, the best Windows ever. Windows 8 on the other hand, felt completely unnecessary. It was force feeding people into its "touch interface is the future!" philosophy. People were more than happy with Windows 7 until Windows 8 dropped with drastic changes and literally nobody wanted.

11 CRYPTOCURRENCY

Bitcoin was definitely one of the buzzwords for the decade. The cryptocurrency that was built on blockchain technology, another buzzword, that was making people rich left, right and centre. Only, it didn't. Everybody was riding the high when suddenly prices began to crash. People who had invested their life savings into Bitcoin ended

up with nothing. Not to mention all the scams that cropped up surrounding other virtual currencies.

12 MICROSOFT INTERNET EXPLORER 6

We see you asking why IE6 specifically. Who uses Internet Explorer at all, right? Well, before Internet Explorer 6 came out in 2001, it was actually the best browser to use, imagine that. IE6.x however, was a security nightmare. The Computer

Emergency Response Team or CERT went as far as urging PC users to use any browser but IE6. Accidentally (or intentionally) visiting the wrong website would flood your PC with Scob or Download.Ject keylogger which stole your passwords. IE7 came out five years (five years!) later, but it was too late to save IE.

13 CLAMSHELL PACKAGING

Arrgh, clamshell packaging! Hard plastic packaging that's somehow immune to scissors, knives, your teeth, anything sharp, and possibly nukes. Imagine buying a pair of scissors, and then needing scissors to open the wrapping for the scissors you just brought. What if that was your first pair of scissors? You're doomed!

14 CAR ALARMS

These days, car alarms are like the boy who cried wolf, nobody takes them seriously. Think about it, when was the last time you heard a car alarm and your first thought was "Oh no! A car's being stolen!". Then there's the fact that they can be triggered by just about anything, a cat landing on the

hood, a passing truck, that's all it takes and boom, sleep ruined.

15 BIG DATA

The big eye in the sky. Everything, and we mean *everything* we do today is being tracked and analysed. Big data has changed the way businesses work, it's all about buying and selling information, and knowing what the customer is likely to purchase. Of course, this has also compromised our privacy, companies know more about us than just our buying habits, and that's pretty scary.

16 IVRS, ROBOCALLS, AND CHATBOTS

You know what's frustrating? Talking to someone (or thing rather) who you know isn't listening. It's equally frustrating being forced to listen to something repeatedly, while you wait in line for your turn to talk to an actual human. Then there's robocalls. We're sure everyone with a phone has gotten at least one robocall. Or a hundred of them. Pre-recorded messages trying to sell you something or the other. No thanks.

17 DATING WEBSITES

You don't need us to tell you that online dating is very popular. There's a lot of dating apps popping up nowadays. Naturally, this wouldn't be on this list if it didn't come with some drawbacks. For one, there's all the scams. Be sure not to give your account details to a Nigerian prince (or anyone for that matter) you met on a dating app. Then there's the catfishing and the fake accounts too. Just be careful when you use one of these.

18 DEEP LEARNING

You can thank deep learning for bringing about deepfakes. Deepfakes used AI deep learning to generate faceswaps. And not just any faceswaps, but scarily accurate ones. Deepfakes could mimic expressions and even speech, i.e., the movement of lips. The potential risk of deepfakes is very high; people could mimic politicians or famous personalities and spread fake news or worse, even incite violence or war! 🚩
