

18 PIECES OF TECH HARDWARE THAT BECAME LEGENDARY

01 MICROSOFT INTELLIMOUSE

The Intellimouse or Microsoft mouse first came out in 1996. Of course, mice existed before the Intellimouse, but what made the Intellimouse standout was the thing it had in between the left and right click buttons. That's right, it was

the first mouse to have a scroll wheel. The scroll wheel also acted as a third button, which could be pressed down.

This is

what would eventually become the standard mouse model that the world would follow.

02 IBM MODEL M

The IBM Model M is an iconic keyboard that released in 1985 as a cheaper successor to the Model F keyboard. The Model M

keyboard was the first to make use of the ANSI 101-key layout that we still use today. It was also the first to utilise the PS/2 connector that is only now beginning to die out in favour of USB.

But that's not all! The IBM Model M was also a mechanical keyboard.

Hardware has come and gone over the ages, and while we may have moved on to better (not necessarily) hardware, there's no denying the impact that these legendary hardware had on the market how they shaped the course of tech history.

Manish Rajesh | manish@digit.in

That's right, a mechanical keyboard from over 30 years ago. It used what was called Buckling Spring switches that were sturdier, and also louder and clickier, than the mechanical key switches we use today.

03 SONY TRINITRON

TVs have come a long way over the past few decades. From being a luxury electronic device to flatscreens being pretty common in just about every household today.

Selling well over a 100 million units worldwide back in the 1960s, the Sony Trinitron was a widely successful colour TV. It stood out at the time for merging three separate electron guns within a single TV set. It was the first TV receiver to win an Emmy Award.

04 COMMODORE 64

1982's Commodore 64 holds the Guinness World Record for the best-selling single computer in history. That should give you enough of an idea for how popular it was. The Commodore 64 single-hand-

edly popularised the idea of having a PC or home computer, arguably more so than any other device in history.

In reality, it was just a rather bulky keyboard which also housed the system. Users just had to plug the Commodore 64 to a TV and you had a computer at your hands.

05 APPLE MACINTOSH

When Macintosh first hit the stores, it took the world by storm. It had a user friendly GUI, it came with a single-button mouse (which looks quite different from what we use today), had the
