

to the video game industry. If you happen to be an avid mobile gamer, be it PUBG, Candy Crush, or anything really, you can thank the Nintendo Gameboy for it. This is the handheld

console that pretty much invented modern mobile gaming as we know it today. Sure it only had a 2.6-inch green screen, and very modest

hardware, but that didn't mean we couldn't have hours of fun from them. Just take a look at the titles, including various Pokémon games on it that skyrocketed to success.

MOTOROLA DROID

Motorola was already a big phone company before the Motorola Droid came out. However, Android was not really very popular. While there had been smartphones

before the Motorola Droid that used Android, it was the Droid that made Android mainstream. This is what made Android devices the biggest competitor to Apple's iPhone. So in hindsight, you could probably thank the Motorola Droid for also cementing the split between Google and Apple's friendship.

13

MOTOROLA DYNATAC 8000X

The Motorola Dynatrac 8000x launched in 1984, and it was the first truly mobile cellphone. Zero wires. This was huge at the time. And so was the phone, which weighed almost a kilo. It also cost a whopping \$4000.

Something interesting about the Dynatrac 8000x is how Marty Cooper, an engineer at Motorola, first publicly demonstrated the device. He made a phone call from the sidewalk to Motorola's biggest rival, AT&T. That's one way to break the news we guess.

14

HP DESKJET

In the 1980s, Inkjet Printers would start replacing noisy dot matrix printers. This is where the HP DeskJet comes in. While it certainly wasn't the first inkjet printer on the market, at \$995, it was the first printer most PC users brought home. You can thank the DeskJet for all the posters, cards, letters, class projects etc which could now be printed right at home, and for far cheaper.

15

JVC GR-C1

Camcorders have played an important role in video media for decades. A milestone when it comes to camcorders was the JVC GR-C1, which was the first all-in-one VHS camcorder. Meaning, this was the first camcorder to have the tape deck attached to the camera itself. Prior to this, you had to lug a separate tape deck along with you and the camera that housed the tape. Of course, you still needed tape to record video back then until it was eventually replaced by flash memory and now, smartphones.

16

PALM PILOT

The Palm Pilot 1000 came out in 1996 and laid down the foundation for handheld computing, that we'd eventually see with the BlackBerry phones, and even smartphones of today for that matter.

The Palm Pilot came with a touchscreen and a stylus, you could take

notes on it, store contacts, schedule entries on a calendar and more. It was basically the world's first PDA or "Personal Digital Assistant". Okay it wasn't the first one, but it was definitely the first popular one and the one we remember the most.

17

RASPBERRY PI

The Raspberry Pi hasn't been around for too long. But we'd say it's definitely become quite iconic for the short time that it's been around. The tiny single-board computer comes with a price that compares to its size at just \$35 and is in no way a threat to PCs you might use everyday.

It's used worldwide by students in order to learn and develop programming skills. Just last year, over 23 million Raspberry Pi were sold. That's pretty crazy.

18

INTEL 8080 MICROPROCESSOR

The Intel 8080 is often credited as the microprocessor that started the PC revolution. The Intel 8080 was based on the Intel 4004 and 8008 that came before it. However, the 8080 was significantly faster and more powerful, with 4,500 transistors vs the 2300 that the 4004 had, and it ran at 2MHz compared to the 0.5MHz that the 8008 ran on. The 8080 laid the foundation for the x86 and x64 processors that we use today.

The Intel 8080 is also what caused Intel to make the switch from a memory company to making microprocessors because of how well it sold back then. Intel made back all costs spent on R&D within five months of releasing the 8080.
