

updated on time. By integrating blockchain into this procedure every participant in the car rental supply chain can observe, share, analyse and update the latest information. With IBM Blockchain in this sector, the entire supply

HireGo is a car rental company that uses decentralised peer-to-peer car hiring structure

chain saw lower processing times, reduced overhead costs and reliable, consistent information.

05 COPYRIGHT AND ROYALTY PROTECTION

One of the unfortunate consequences of growing internet access in our world is that copyright and ownership laws have become somewhat hazy for music and other content. By using blockchain, musicians and content creators could access real-time and transparent royalty distribution data and would have a better understanding of where and how their content is being accessed. With blockchain, copyright laws will be beefed up quite a lot for online content downloads which ensures that the artist of the content that is being purchased gets their own fair share of royalties.

06 DIGITAL VOTING

Blockchain, being immutable, can be the answer to voting frauds plaguing the world, especially India, during elections. With blockchain, voters will be able to vote digitally. This coupled with blockchain's immutable nature makes for a more secure voting system. So, once a vote is given, it cannot be changed or tampered with. Blockchain is transparent, therefore, regulators will be able to understand immediately if there were any nefarious activities like tampering of votes or changing the vote count.

07 WEAPONS TRACKING

Gun control and weapons accountability have been a hot topics of discussion for a few years now owing to the increasing number of mass shootings around the world, especially the US. By bringing blockchain into the picture, a transparent and unchangeable registry network can be created which will allow the police and other government agencies to track weapon ownership. This technology lets law enforcement keep a record of weapons sold independently with the personal details of the owner as well as details of the model and make of the weapon.

Mass gun shootings are becoming a prevalent concern around the world

08 AUTOMATE WILLS OR INHERITANCES

Blockchain may actually be able to put your end-of-life concerns to rest by automating wills and inheritances. Paper wills are usually not too secure and can end up getting misplaced or misunderstood. Soon people will have the option to record and store their digital will on a blockchain network. When used alongside Smart Contracts, the technology can automatically give out inheritances to beneficiaries once they meet the desired criteria (for example, once a grandchild turns 18). Additionally, since everything is recorded on this immutable network the will is crystal clear and legally binding and leaves no doubts about who gets the inheritance once someone passes away.

09 SECURE MEDICAL RECORDS

Doctors, nurses and other healthcare professionals are often limited in the standard of care they

can provide. This happens since these professionals are deprived of easy or complete access to your medical records. You can publish your medical records securely on a blockchain and allow only verified or authorised people to access these records from anywhere in the world. The Estonian government has collaborated with Guardtime, a blockchain technology company, which has built a blockchain database of citizens' medical records.

10 TRACKING PRESCRIPTION DRUGS

A decentralised prescription drug tracking system can help

Blockchain system can be used to track prescription drugs back to their source

in streamlining healthcare processes in India. Blockchain technology can allow drugmakers to track their products and supply chain by utilising serial or batch numbers and trace them back to the place of manufacturing. This ensures that customers are getting authentic prescription drugs when they pick them up at pharmacies. Tracking prescription drugs using a decentralised blockchain system can help combat counterfeit medicines that are quite prevalent.

11 EQUITY TRADING AND FORECASTING

Blockchain can possibly, in the near future, replace or rival current equity trading platforms that allow purchasing and selling of stocks. Blockchain systems are extremely efficient since their networks validate and close transactions very quickly. This could possibly eradicate the wait time, usually days long, that investors encounter when selling stocks. Additionally, it also eliminates the need
