Pie tips and tricks.

Huawei Ban: Broadcom forecasts reduced earnings

Technology companies were rattled after Broadcom forecasted a reduction of \$2Billion in sales revenue this year. The company cited the US Ban on Huawei to be the cause. The announcement saw shares of numerous technology companies taking a hit.

WHAT'S NEW

Libra - Facebook's foray into the world of cryptocurrency

Facebook unveiled Libra, a new cryptocurrency and a supporting payments infrastructure, with the support of a consortium of organisations that include credit card companies such as VISA and MasterCard, venture capitalist firms and tech companies such as Uber, PayPal, and Booking.com. All companies vying to be part of the Libra Association, an independent body that will govern the crypto coin, will have to invest \$10 million to fund the development of the

cryptocurrency and its ecosystem. It will be a stablecoin, i.e. Libra will be backed by a set of FIAT currencies so it will be more stable than cryptocurrencies. A full release of Libra is planned in 2020. Facebook hopes to integrate Libra into its messaging services as well. Facebook is also looking to set up ATM-like kiosks which will allow people to convert fiat currency into Libra. Libra will launch in all countries except India, China and a few others.

Firefox ramps up efforts to block online tracking

The last couple of years have seen a spate of privacy-related incidents with major technology companies being the offenders. So, we've begun seeing more announcements from companies about being more privacy-conscious and taking steps in this regard. Google, on the other hand, seems to be going the other way by preventing ad and tracker blocking extensions from functioning as normal in

Chrome. The list of changes, dubbed Manifest V3, will make its way into the developer

preview soon. It will implement changes to web request API which is used by ad blocking extensions to block web

tracking methodologies. In light of this, Firefox plans to do the right thing, i.e. enabling their "enhanced" tracking protection by default on all installations. This will block third-party cookies that help companies advertise, track, etc. Firefox also announced an upgrade to its Facebook container extension which isolates Facebook from the rest of the user's activity. It's time to switch to Firefox.
