

Google Sheets

There's much more to Google Sheets than what meets the eye.

FOR MANY, THE FUNCTIONALITIES OF SPREADSHEETS LIKE EXCEL AND GOOGLE SHEETS have been shrouded in mystery. Often, users barely scratch the surface of what they can actually do on something as simplistic but powerful as Google Sheets. Most times, Google Sheets is just a convenient and free alternative to Microsoft Excel, which eliminates users' desire to delve as deep as possible into the countless features of Sheets and they usually only stick to doing surface-level work. Let's look at some tips and tricks that can take your Google Sheets experience to a new level.

ADD SPARKLINE FOR EASY DATA VISUALISATION

There are multiple times when we come across a database of figures that would be better understood visually. Sheets now allows you to create a tiny chart within a single cell for quick reference and visualisation. You will need to use the `=SPARKLINE` command, followed by the cells which hold the data you want to include. This will provide you with a simple line chart. In case you want

a different kind of visualisation, simply follow the cell numbers with the word "charttype" and then the kind of chart you require - such as bar or column.

The format is
`=SPARKLINE(A1:A5, {"charttype", "column"})`

ADD IMAGE WITHOUT HAVING TO UPLOAD

If you simply want to insert an image you found online, without having to download it and upload it again

The sparkline feature isn't just limited to lines, you can make bars and columns as well

onto Sheets, you can simply left-click on the image in the website and hit copy. Then simply paste it into Sheets. However, if you want to insert an image into a cell directly using the URL, you can use the `IMAGE` command followed by the link of the image.

The format is
`=IMAGE("https://www.digit.in/static/image/digit_logo.png")`

ACCESS UP TO DATE FINANCIAL DATA WITHIN SHEETS

Google Sheets can access Google Finance (who knew? It's still a thing) from within itself whenever you require any kind of stock knowledge. The system can provide you with real-time or historical stock prices as well as all kinds of other market-related data for any publicly traded company. All you need to do is use the `GOOGLEFINANCE` formula. You can find a set of possible permutations and combinations by visiting this page - <https://digit.in/googlefinance>.
