

## TRIM EXTRA WHITESPACE

In many cases, when you have a ton of unfiltered data, especially as seen in organizations or government data, they have a ton of discrepancies, one of which is unnecessary white spaces. In order for computational methods which sort and assemble data to work well, they need to be in standardised formats. You can now use the trim whitespace feature to remove any leading, trailing or whitespace. Select the data you want to use this feature on, go to Data and then click on Remove Whitespace.

## WATERFALL CHARTS IN GOOGLE SHEETS

In the past, Google Sheets users would create Waterfall charts using the Stacked Bar Chart feature. The method was time-consuming as users would first have to arrange their data in a unique manner. Now Sheets has the feature to create Waterfall Charts, so you can bid the old, time-consuming method goodbye. Select a data range and then go to Insert in the menu and then Chart. From the Chart Editor

Creating a Waterfall Chart in Sheets isn't a hassle anymore

## GROUPS ROWS AND COLUMNS

When users work with spreadsheets of data, they are often switching between various levels of information. By grouping rows and columns, you can collapse or expand them giving you better control over the visibility of data when required. Sheets has now added this functionality. All you need to do is select multiple rows or columns you want to group and then right-click anywhere inside this selection and click on 'Group rows x - x' or 'Group columns x - x'. The grouped columns or rows will be depicted by a thin bracket along with a small button with a minus sign on it. Click to collapse the group and click again to expand.

## INSERT CHECKBOXES

Google recently added the ability to insert checkboxes into cells in Sheets. They are more like a visual 'true and false' in the spreadsheet. To insert a checkbox in Google Sheets, first go to the menu and find Insert and then click on Checkbox in the dropdown menu. Since checkboxes assign the TRUE and FALSE value to checked and unchecked boxes respectively, you can link this cell with any formula. For example - if this value is linked to an IF statement, it will take the value of the checkbox and then apply the formula.

## CREATE A NEW SPREADSHEET QUICKLY

This is a simple tip, but it can save you some valuable time when you are creating a new Sheet. You may be familiar with the seemingly semi-arduous process of navigating to Google Sheets and then clicking on new file every time you want to create a new one. The company has created an efficient shortcut to do this easily as soon as you open your browser. All you need to do is type 'spreadsheet.new', 'sheets.new' or 'sheet.new' and hit enter. You will be automatically redirected to a new Sheet.

**Note:** You can do the same for Docs, Slides and Sites by typing 'doc.new', 'slide.new' and 'site.new' respectively.

## MACRO RECORD FEATURE

Google Sheets recently got the ability to record macros in the cloud in order to automate repetitive tasks and formatting options. Let's say you need to format some new data imports or perhaps, build the exact same chart across multiple sheets. Repeating these same steps manually can be time-consuming. Sheets macro recorder allows you to record these actions and play them back whenever you need without needing to write code or learn Google's App Script language. To record a macro, click on Tools > Macros > Record Macro. Once you are done recording your macro, hit 'save' at the bottom of the screen. You can name your macro and even assign it a shortcut key. When you need to use a recorded macro, go to Tools > Macros and then click on your newly created macro.
