## GOOGLE BLOCKS IS A VR, MINECRAFT-ESQUE APP

that allows users to immerse themselves in a 3D world where they can speedily build objects in a virtual reality setting. Traditionally, the adoption rate of VR and AR has been painfully slow in the past, however, Google aims to eradicate this barrier and provide an user-friendly, fun way to build 3D objects in the virtual world which can be used by novices and professionals alike.

The app requires a VR headset, specifically the HTC Vive or the Oculus Rift, and can be bought on Steam.

Once you are inside the VR world, you will have access to six simple tools on the surface which include - Shape, Stroke, Paint, Modify, Erase and Grab. The possibilities of the kinds of 3D models you can fabricate are literally endless. The models can be exported to use in AR or VR applications, can be shared on social media or your website. You can even design animated GIFs with the models you create. Let's look at some tips and tricks to elevate your 3D object creation abilities on Google Blocks.

## ADD NEW ENVIRONMENTS

When Google Blocks was first launched, users could only create 3D objects in a

simulated desert-like environment. However, with a recent update, Google Blocks now offers a total of four

The ability to change the environment or background theme was much requested

modelling environments to their users. The first is the classic desert setting, the second is a night version of the classic desert since us-

ers were often complaining about how the original desert environment was too bright for long creation sessions. The next two are simple bold colour backgrounds namely - black and white. If you look up while creating objects in the black theme, you will see a sky full of stars which is a nice touch. Or, it could be a dizzying array of spots since you've spent way too much time in this simulated world. Who knows?

Additionally, the environment that was used in the last session will automatically be set as the default theme for following projects.

## GROUP OBJECTS TO MOVE THEM TOGETHER

This is a useful feature which is available in Blocks but is generally looked over. However, when you are creating large, complicated projects, grouping objects together is very useful since it is extremely tedious to move every piece separately or to manually select every ele-
