

EBay Crash Sales

EBay is preparing for Prime Day with a sale that will only go live if Amazon's site crashes. <https://digit.in/july19-98>

Candy Crush Addiction

Candy Crush developer says 9.2 million users play the game for at least 3 hours a day. <https://digit.in/july19-99>

Nokia 2.2

Not worth the money

The Nokia 2.2 is the cheapest Nokia smartphone you can get without getting into the Android Go universe. How does it fare? Let's find out.

Build and Design

The Nokia 2.2 looks and plays the part of a budget smartphone with very ordinary levels of build and design. The glossy back panel seems sturdy but not particularly eye-catching.

It has a modest single-sensor shooter on the back with a single LED flash. You also retain the 3.5mm audio jack. There's a dedicated Google Assistant key, microUSB port, a primary microphone, a power button and volume rocker on the device. The volume keys are hard to press because of the inward curvature of the body.

The lower right side has a tiny tab with which the user can remove the back panel entirely. On the inside, we see one card slot for the primary SIM card and another for an SD card. Most of the space is occupied by a removable 2920mAh Li-ion battery.

Display and Audio

The device has a 5.71" LCD panel with a resolution of 720x1520 pixels. The top of the display has the "Selfie notch", a circular notch for the selfie camera.

There's a noticeable drop in quality of the display in comparison to the Nokia 4.2. Colours look a tad darker than they are in reality. Brightness, according to our test kit, ranges all the way from 5 to 666 LUX. The display has a glossy finish and is definitely a fingerprint magnet.

The Nokia 2.2 has a single loudspeaker, which is decent for calls, ring tones, and alarms but not for music. The sound is muddled and unclear.

Performance

The Nokia 2.2 employs a MediaTek Helios A22 chipset. Built on a 12-na-

nometre process, the Helios A22 offers four ARM Cortex-A53 CPU cores at 2.0GHz. The GPU onboard is a PowerVR GE8320.

On AnTuTu 7.0, the unit scored 61554 points. On 3DMark's SlingShot, the Nokia 2.2 scored 440 points. On PCMark Storage, it scored 7069.

In everyday scenarios, the Nokia 2.2 review unit was almost a pain to use. Everyday apps, such as YouTube and Chrome, would take about four to six seconds on an average to launch, which is painfully long.

Gaming was equally painful and disappointing. According to our Gamebench metrics tool, PUBG Mobile, ran at 15 frames per second on forced low graphics settings.

The Nokia 2.2 has the latest near-stock version of Android, 9.0 Pie.

Camera

Nokia 2.2's single shooter is a 13MP 1.12um sensor with an aperture of f/2.2 and autofocus. It's accompanied by a single LED flash. The front camera is a 5MP unit.

Photos taken in daylight through the smartphone's rear sensor are somewhat dull and lacking in detail. Colours appear faded and washed out. Zooming reveals the loss in detail. Photos taken indoors are mostly noisy and colourless. Lowlight photos are grainy and blurry. Selfies, on the other hand, appear significantly sharper around the main subject. They turn noisy and blurry in low light. The default camera app is slow to react and nearly unusable. Switching between photo and video modes takes nearly two seconds.

Battery

The Nokia 2.2 has a user-removable battery, rated at 2920mAh. This feature brings out nostalgia for the times we could remove batteries on smartphones.

According to our standard battery benchmark test, the Nokia 2.2 scored 7 hours, 31 minutes. In comparison, the Nokia 4.2 and Redmi 7 scored 8 hours, 50 minutes and 9 hours, 5 minutes respectively. In everyday use scenarios, the Nokia 2.2 review unit lasted a little over a day with moderate use, which included some thirty

minutes of gaming, twenty minutes of browsing, and a few app installs. When the phone remained in a bag, unused for almost two full days, the battery dropped from near full to 30 percent. Charging from 10 percent back to full took nearly two full hours on the standard bundled charger.

Nokia 2.2 Verdict

When compared with phones like the slightly costlier Redmi 7, the Nokia 2.2 has little to set itself apart, except for the fact that it comes with Android One. Though it promises timely updates and a clean stock Android-like UI, it renders itself nearly unusable because of the phone's underpowered chipset. We recommend that you forget the Nokia 2.2; get the beefier Nokia 4.2, or the Redmi 7.
