Teardown: MacBook Pro 15" Touch Bar 2019

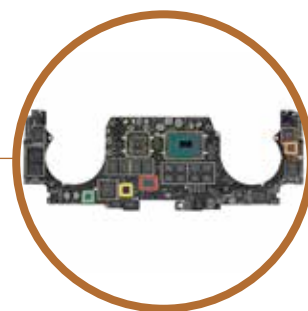

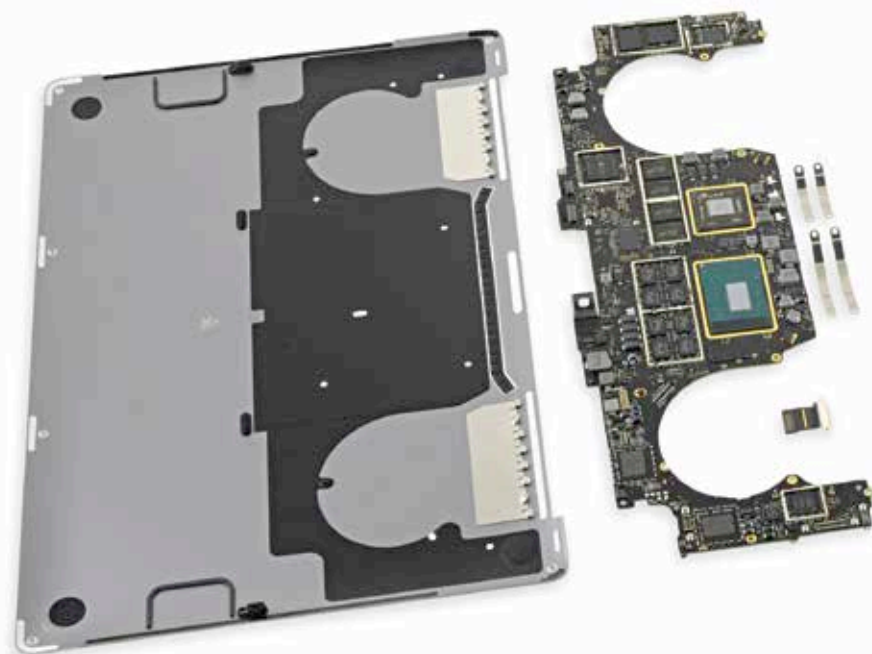

A six-core processor and mysterious new keyboard materials

Dhriti Datta | dhriti@digit.in

Indistinguishable hardware

On paper, the new 2019 MacBook Pro seems to integrate only a spec bump with no radical changes to the hardware. When opened up, the above statement seems to be true since the hardware appears to be the exact same as the MacBook Pro 2018 model.

Array of chips

The MacBook Pro 2019, like its predecessor, has multiple chips like the Intel SR40F platform controller hub, Texas power controllers, Apple PMIC, TPS51980A power controller, Wi-Fi and Bluetooth module, Intersil 6277A PWN modulator and Cirrus Logic audio codec fixed on to the logic board as well.

Zero modular components

The device doesn't incorporate any modular components, so there seems to be absolutely no chance of upgrading any of this hardware or even fix it easily. The 9th gen Intel i7-9750H 6-core processor, AMD Radeon Pro 555X GPU and other components like RAM and storage are soldered onto the logic board.
