

Forgotten bomb

A massive crater appeared overnight in Germany possibly caused by a WWII unexploded bomb. <https://digit.in/july19-52>

2019 M0 Asteroid

This Asteroid entered Earth's atmosphere recently and burned out in the sky as a fireball. <https://digit.in/july19-53>

UNSOLVED MYSTERIES OF SCIENCE

Also known as Nobel prizes that are just waiting to be won, here's a list of things humanity is left scratching its head about...

W

e're a cocky bunch, us humans. In fact, the less we know as individuals, the cockier we seem to

be. That's the human condition at work. We brag about our accomplishments and hide our failures.

This article attempts the exact opposite, and wants to look at how little we know about so many things we seem to take for granted in science. Before we start, however, don't expect to see things like evolution, vaccines, climate change, or any of the conspiracy theories that abound as a testament

to sheer human stupidity. Those things are already settled questions.

With that out of the way, we'll also mention that you won't see a few popular mysteries of science mentioned here... for that very reason – they're too popular. Now, let's get right into it.

TIME

Time is a popular topic that we think we know the nature of, and yet we don't. Let's do a thought experiment. Walk three steps forward. You have now moved a particular direction in space, but you want to get back to your comfortable seat now. Thus, you walk three steps back. Now, can you go back 10 seconds and unread this paragraph? If time really is a dimension, then travel backwards and forwards

should be possible, and yet, we already know that time travel to the past is impossible, and yet we travel exactly one moment at a time into the future!

So if it's not a dimension, what is it? We just don't know what the nature of time is. Can it be stopped? Rewound? Fast forwarded? You can fool it by travelling close to the speed of light out in space while your family is on earth. That would cause you to experience time differently, since time is relative. You could return a decade later in Earth time and only a few months would have passed for you! But that's just using speed to minimise the effects of time. It's not reversing what is called the Arrow of Time (one-way direction of time - past is behind, present is here, and future is forward).

Philosophically, time has always been of great interest, and caused a lot of controversy, so much so that there are schools of thought that think time isn't actually a thing. Perhaps it's not time that we experience but entropy.
